# Smart Lighting

## *Problem description*

- Effective street lighting systems provide inhabitants with safety and comfort during dark time
- Problem:
  - Static lighting
    - Most of the time light remained unclaimed
    - Energy is wasted uselessly
    - Light pollution

## *Possible solutions*

---

- Turning off lights
  - Not solution at all
  - Safety and comfort impact
- Using motion detector sensor
  - Narrow coverage of motion sensor
  - Allow to see only near field

*How it will look like*

*How it will look like*

# How it will look like

# How it will look like

# How it will look like

# How it will look like

# How it will look like

## *How to do this*

---

- Streetlights are driven by controllers
- Controllers interconnected in common network
- Light state depend not only state of local sensors, but also on states of all nearby sensors
- Based on information system decides which set of lights should be turned on

# Struggles

---

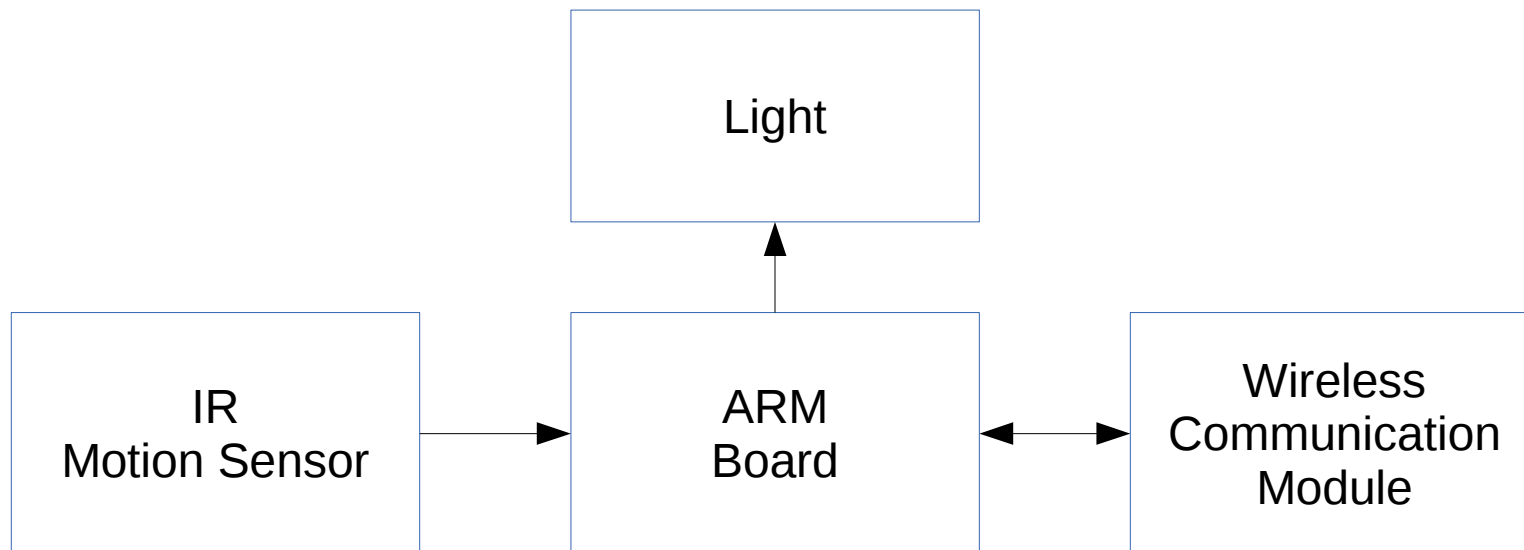

- Very large network
  - ~1000 light poles in town like Köthen
- Autoconfiguration
  - Manual configuration of each node will lead to enormous deployment costs and could be impossible
- Connectivity
- Control algorithm

# Light controller

- ARM board + Linux OS
  - Low costs
  - Low power consumption
  - Flexible

# Sensor network

- Wireless mesh networks
  - Easy to deploy
  - Mature technology
- Using IPv6 stack
  - Compatibility with existing networks

# *Autoconfiguration and Control Algorithm*

---

- Combine information acquired by wireless network
  - Near by-standing controllers can see each other in network directly
- Using Machine Learning techniques to discover behavior patterns
  - Gathering data from sensors into on storage
  - Analyze and create model of pedestrians movement
  - Apply model

# Benefits

- Energy saving
- Increase comfort and safety
- Lower energy requirements during night could benefit in case of use solar energy
- Side effects
