## Appendix D

## Changes from Previous Versions

This appendix provides version history of the standard and summarizes updates that have been made to conformance specifications, character content, and data files in the Unicode Character Database since the publication of The Unicode Standard, Version 6.0.

## D. 1 Versions of the Unicode Standard

The Unicode Technical Committee updates the Unicode Standard to respond to the needs of implementers and users while maintaining consistency with ISO/IEC 10646. The relationship between these versions of Unicode and ISO/IEC 10646 is shown in Table D-1. For more detail on the relationship of Unicode and ISO/IEC 10646, see Appendix C, Relationship to ISO/IEC 10646.

Table D-2, Table D-3, Table D-4, and Table D-5 document the number of code points allocated in the different versions of the Unicode Standard. For an explanation of the types of characters which count as graphic or format in these summary statistics, see Table 2-3, Types of Code Points. In each table, the row labeled "Graphic + Format" represents the traditional count of Unicode characters and is the typical answer to the question, "How many charac-
ters are in the Unicode Standard?" The numbers cited in the row labeled "Han Compatibility" in each table include the 12 unified CJK ideographs encoded in the CJK Compatibility Ideographs block.

Table D-2 lists the allocation of code points by type for the earliest, historic versions of the Unicode Standard up to the publication of Version 3.0. In some cases the values in Table D-2 differ slightly from summary statistics published in those very early versions of the standard, primarily due to a refined accounting of the allocations in Unicode 1.0.
