Introduction

- Following the introduction of the **Homoglyph bundling** mechanism, any domain name into the .eu registration system will go through a number of tests. These tests will check if a domain name might be visually similar (or homoglyphic) to other ones.
- This document details technical rules taken from the [IDNA2008 protocol](#) and also coming from the [Homoglyph bundling mechanism](#).
- The following technical topics will be discussed:
 - [Allowed characters](#);
 - [Case folding](#);
 - [Normalisation](#);
 - [Homoglyph bundling mechanism](#).
 - [Character tables](#) provides the comprehensive and detailed lists of characters for each script.

Allowed characters, Case folding and Normalisation topics are linked to the [IDNA2008 protocol](#).

IDNA2008 protocol

- IDNA means Internationalized Domain Names for Applications.
- IDNA is a set of standards that allow client applications like Internet browsers to convert strings expressed in Unicode to an encoding form that is compatible with ASCII.
- IDNA allows EURid to offer Internationalized Domain Names (IDNs) for registration. IDNs allow to register domain names in local languages and scripts.
- The IDNA2008 protocol supplemented the previously deployed IDNA2003 protocol. Consequently, new characters were supported when registering a .eu domain name while others were phased out. This document mentions the characters that the IDNA2008 protocol supports.

Allowed characters

- A domain name is considered as valid if it contains exclusively characters from one of the following scripts:

- Latin for .eu domain names;
 - Cyrillic for .eю domain names;
 - Greek for .eυ domain names.
- Mixing characters from two or more scripts in one domain name is not allowed. The exceptions to this rule are the following characters, which are considered as generic:
 - digits [0-9];
 - hyphen.

Digits and hyphen can be freely used in any Latin, Cyrillic or Greek domain name. EURid implemented this rule as of December 2009 when Internationalized Domain Names (IDNs) were launched.

Tables for [Allowed characters](#) can be found here.

Case folding

- The term **Case folding** has to be understood as an operation converting characters from uppercase to lowercase.
- To avoid inconsistencies due to local or cultural aspects in language, the IDNA2008 protocol does not allow uppercase characters when registering a domain name. It leaves the management of uppercase characters to client software like Internet browsers.
- Until 2015, the .eu registration system was based on the IDNA2003 protocol; this standard did allow to use uppercase characters when registering domain names. Furthermore, it defined case folding tables. Hence, EURid allowed to input uppercase characters when registering a domain name under IDNA2003 rules.
- To keep backwards compatibility with IDNA2003 rules, the IDNA2008 .eu registration system will still allow uppercase characters as input. However, IDNA2008 rules do not provide for case folding tables. Accordingly, the registration system implements its own case folding tables as part of the registration process.

Tables for [Case folding](#) can be found here.

Normalisation

- IDNA2003 allows certain characters as input. However, it will map them to other ones. The mapping operation is named normalisation.

Example 1. Normalisation

- The Latin Small Letter L with Middle Dot (U+0140) is allowed as input. However, this character is replaced by the two characters Latin Small Letter L (U+006C) and Middle Dot (U+00B7).
- On the other hand, IDNA2008 rules do not allow these characters as input; they only allow characters that IDNA2003 maps into.
- To ensure backward compatibility, the .eu IDNA2008 registration system does allow these characters as input. However, the registration system will perform a similar mapping as IDNA2003.
- This operation is called **normalisation**.

- Domain names expressed in Cyrillic script are no longer concerned by normalisation.
- The normalisation tables of Latin and Greek scripts are available under the section [Normalisation](#). The tables contain characters that are normalised at present.

- The domain name currently registered is the one that is the result of the normalisation.

Homoglyph bundling mechanism

- In order to determine if two .eu domain names might be visually similar (homoglyphic), tables are used to list all visually similar characters. All domain names of a homoglyph bundle are homoglyphic to each other. The general rule specifies that domain names can only be in a homoglyph bundle if they are built from different scripts.

Some exceptions to this rule exist. They are mentioned in the [Intra Script homoglyph bundling tables](#).

- Each table defines the characters in one script that have a visually similar character in another script. In order, for example, to determine if a domain name written in Latin script is in the

same homoglyph bundle as a domain name written in Greek script, all characters in the Latin script domain name are translated into their Greek equivalents. The [Latin to Greek bundling - Single mappings](#) will be used in this case. All characters of the domain name need to appear in the bundling table for domain names to be in the same homoglyph bundle.

- The bundling tables will show lowercase characters only, although the actual visual similarity might be valid for the uppercase characters.

Example 2. a with Alpha

- The Latin small letter a (U+0061) is bundled with the Greek small letter α (Alpha U+03B1).
- The visual similarity is also applicable to the uppercase version of both characters.

- As digits and the hyphen can be freely used in any of the three scripts (Latin, Greek, Cyrillic), they can appear in domain names in different scripts, but can be considered to be homoglyph. See [Allowed generic characters](#) to obtain the list of digits and hyphen characters.

Example 3. Sequence of two characters in Latin and Greek scripts that are considered as homoglyph

Let us consider the following string of two characters:

Table 1. a and Alpha one

String	Meaning	Unicode code points
a1	the Latin small letter a + 1	U+0061 and U+0031
α1	the Greek small letter Alpha + 1	U+03B1 and U+0031

- These two strings are considered as homoglyph of each other.

- Inter script homoglyph bundling tables are available here: [Inter Script homoglyph bundling tables](#). These tables list characters considered as homoglyph for each combination of the Latin and Greek scripts.
- Domain names expressed in Cyrillic script are no longer concerned by the homoglyph bundling mechanism. This statement is applicable as of October 2019.
- Intra script homoglyph bundling tables are available here: [Intra Script homoglyph bundling tables](#). These tables contain characters that are considered as homoglyph within the same script (Latin or Greek).

Character tables

Allowed characters

- The first column mentions the character in the actual representation;
- the second column gives the official Unicode code point;
- the third column lists the official Unicode character description.

Table 2. Allowed generic characters

Character	Unicode	Description
-	U+002D	HYPHEN-MINUS
0	U+0030	DIGIT ZERO
1	U+0031	DIGIT ONE
2	U+0032	DIGIT TWO
3	U+0033	DIGIT THREE
4	U+0034	DIGIT FOUR
5	U+0035	DIGIT FIVE
6	U+0036	DIGIT SIX
7	U+0037	DIGIT SEVEN
8	U+0038	DIGIT EIGHT
9	U+0039	DIGIT NINE

The Greek script normalisation table is taken from the IDNA mapping table referenced by the [Unicode Technical Standard #46: Unicode IDNA Compatibility Processing](#).

Inter Script homoglyph bundling tables

The following table provides homoglyph bundling tables for each combination of each combination of the Latin and Greek scripts:

- the single mappings table lists the characters for which there is exactly one character in the other script that is visually similar;
- the multi mappings table lists the characters that have more than one similar character with the other script;
- the special cases table mentions exceptions.

Table 18. Intra script Latin bundling

From Latin	To Latin
ss String of two LATIN SMALL LETTER S (U+0073)	ß LATIN SMALL LETTER SHARP S (U+00DF)
· MIDDLE DOT (U+00B7)	- HYPHEN-MINUS (U+002D)

Detailed information about the Latin S

- Although visually not similar, the string of two Latin small letters S (U+0073) is bundled with the Latin small letter Sharp S (U+00DF).
- This is due to the different processing of the character U+0073 between rules IDNA2003 and IDNA2008.
- In IDNA2003, the character U+0073 was replaced by a string of two Latin letters S. In IDNA2008, the character U+00DF is considered as acceptable. Accordingly, this character is no longer converted into the string of two Latin letters S.
- Considering the fact that Internet browsers (and other client software) currently implement IDNA2003, users might be lead to the wrong website. This is even applicable if the vendor adapted their software to support IDNA2008; it depended on the end user whether the client software was upgraded or not.
- By bundling these two representations, the scenario where two domain names are registered that only differ in this respect, is prevented.

About the Greek extended character set, characters with accent (like Psili, Dasia and Varia) are considered to be visually similar to the corresponding character without the accent.

Detailed information about Greek characters

- As can be seen in the normalisation tables, Greek characters with Oxia are mapped into the equivalent Greek characters with Tonos. As Greek characters with Tonos are from the base Greek character set and not the extended character set, they are not bundled with the characters without the accent.
- The IDNA2008 protocol does not allow extended Greek characters with Ypogegrammeni. IDNA2003 does allow them. However, IDNA2003 converts these characters into the equivalent characters without the Ypogegrammeni part. It also adds an extra separate Greek letter Iota after the character.
- To ensure backwards compatibility, the .eu registration system does allow these characters as input. However, the system converts them as described above. As a net result, no domain name could exist under IDNA2003 rules in the registration system that contains a character with Ypogegrammeni. This situation is kept under IDNA2008 rules. Therefore, an end user seeing a domain name mentioned somewhere containing a character with Ypogegrammeni, may type it in with the equivalent character without the Ypogegrammeni.
- In order to avoid confusion and abuse, the character with Ypogegrammeni, which will be transformed by the registration system into the equivalent character followed by a Greek letter Iota, will be bundled with the equivalent character without the Ypogegrammeni.

Example 4. Greek bundle

- The domain name **ααα.ευ** is converted via normalisation tables into **αιαιαι.ευ**.
- It will be bundled with all the following domain names:
 - ααα.ευ;
 - αιαι.ευ;
 - αιαιαι.ευ;
 - αααι.ευ.
- Not all possible combinations are listed.
- The table contains both the character with Ypogegrammeni as well as the mapped version (as per the normalisation tables described above).

Table 20. Intra Greek script Sigma bundling

Character	Character
ς GREEK SMALL LETTER FINAL SIGMA (U+03C2)	σ GREEK SMALL LETTER SIGMA (U+03C3)

Detailed information about Greek small letters Sigma

- The IDNA2003 protocol maps the Greek small letter final Sigma (U+03C2) to the Greek small letter Sigma (U+03C3). IDNA2003 rules considered the Greek small letter final Sigma (U+03C2) as an invalid character.
- Since the implementation of IDNA2008 rules, the Greek small letter final Sigma (U+03C2) is considered as a valid input. To avoid confusion and abuse, especially in light of Internet browsers still using IDNA2003 algorithms, the characters U+03C2 and U+03C3 are bundled. It means that no two domain names can be registered together where the only difference is the exchange of a character U+03C3 by a U+03C2, or vice versa.
- Furthermore, both characters U+03C3 and U+03C2 will display the same representation if they are converted to uppercase characters.
