Metric Labeling on Packages in Retail Stores

Abstract: Use of metric units in United States consumer product labeling has a long history. Currently, the Fair Packaging and Labeling Act (FPLA) requires dual labeling, while products regulated by states under the Uniform Packaging and Labeling Regulation (UPLR) are permitted to display metric labeling¹. In an effort to characterize current U.S. marketplace labeling practices, the net quantity of contents statement labeling of at least 1137 packages was examined in 19 retail stores, including those that sell food, home and personal care products, hobby and arts and crafts products, automotive, hardware, office products and pet supplies.

The assessment found that retailers across the United States are selling both domestically packaged and imported products labeled with only metric units in the net quantity of content statement. Of those packages examined, 17 % declared the net quantity of contents in only metric units. Almost 57.5 % of those metric packages were found to be noncompliant with current FPLA dual labeling requirements. The majority of the parties responsible for manufacturing or distributing 61 % of the metric products were U.S. companies. Metric packages are present in the U.S. marketplace and consumer exposure to metric packaging is growing as demonstrated by their availability in a broad range of retail stores.

Introduction

Consumer product labeling practices in the United States has a long history of using and permitting metric units. The 1966 Fair Packaging and Labeling Act (FPLA)² required net quantity disclosures on packages be made in the customary inch-pound system of measurement. However, the implementing regulations adopted by Federal Trade Commission (FTC), the Food and Drug Administration (FDA), and the Uniform Packaging and Labeling Regulation (UPLR) also allowed metric units to be displayed. In 1992 Congress amended the FPLA to require net quantity disclosures on packages to appear in both metric and inch-pound units, which is known as “dual” labeling (Figure 1). A wide variety of consumer commodities fall under the FPLA (Appendix A).

In 1999 the National Conference on Weights and Measures (NCWM) amended the Uniform Packaging and Labeling Regulation (UPLR) to permit packages that are subject only to state regulation to display only metric units, known as “metric” labeling (Figure 1), which is consistent with the federal policy that the metric system is the preferred system of weights and measures for commerce in the United States (15 U.S.C. 205b).

¹ The term dual labeling refers to using both metric and inch-pound measurement units in a net quantity of contents statement. The term metric labeling refers to using only metric measurement units in a net quantity of contents statement.

² (15 U.S.C. §§ 1451-1461)

Figure 1 – Dual and Metric Packaging Examples. Juice A and B feature a dual net quantity of contents statement in the label, which is required under the current FPLA. Juice C features a metric label, which is currently permitted under the UPLR, but prohibited by the current FPLA. The proposed FPLA amendment would permit U.S. manufacturers to choose either dual or metric labeling for their products.

Metric units appearing on packages have proven to be informative and have helped many U.S. consumers learn to relate metric quantities to the equivalent inch-pound quantities. Consumers are able to review the net quantity of contents statement between dual and metric labeled products (**Figure 1**), to make simple and easy value comparisons using the metric value. Comparisons between multiple inch-pound values commonly found in net quantity of contents statements often involve mathematical calculations to make value comparisons (**Figure 1**). Metric labeling does not require specifically designed metric sizes, allowing current quantities found in the U.S. marketplace to be used. More on metric labeling and the proposed FPLA legislation is available from NIST³.

U.S. retailers purchase consumer goods manufactured in other countries, where metric labeling is dominant, and import them into the U.S. marketplace. Because both metric and inch-pound units are required by federal law and metric labeling is dominant on products outside the United States, this assessment expected:

- No metric labeled FPLA packages would be present in the U.S. marketplace.
- The majority of consumer package labels would be compliant with FPLA regulations, bearing dual unit net quantity statements.

³ See the Voluntary Metric Labeling whitepaper, which is available at <http://www.nist.gov/metric>.

- The majority of UPLR regulated packages would be compliant with regulations. A limited number of metric labeled UPLR products would be present.
- If metric labeled FPLA or UPLR packages were identified, the majority would have a Responsible Party from outside the United States.

Methodology

This marketplace assessment was conducted by National Institute of Standards and Technology (NIST) Weights and Measures Division (WMD) Laws and Metric Group staff between April 14, 2008, and September 4, 2008. The assessment covered a broad community of retail stores (19, listed in Appendix B) and sectors including food, home and personal care products, hobby and arts and crafts, automotive, hardware, office products and pet supplies. The manufacturer or packager was identified on each product by reviewing the declaration of responsibility. The measurement system used was determined by reviewing the product net quantity statement, often located in the lower 30 % of the primary display panel (PDP).

Observations

Metric labeled products are currently being manufactured and distributed within the U.S. retail marketplace. The assessment found that national and local retailers are selling both domestically packaged and imported products labeled with only metric units. Metric net quantity was declared in 17 % (193) of the products observed. Current FPLA dual label requirements were not used as mandated in 57.5 % (111) of those metric packages. U.S. companies were found to be responsible for manufacturing or distributing 61 % (118) of these metric products (Table 1). A high level of FPLA compliance with dual labeling requirements was found in the food sector.

Table 1

Assessment Results		
Total Packages	1137	100 %
Metric	193	17 %
Packages with Only Metric Units		
FPLA & UPLR	111	57.5 %
UPLR	80	41.5 %
EPA	2	1 %
Declaration of Responsibility of Metric Products		
USA	118	61 %
Other	48	25 %
None	27	14 %

Metric-Only Products Are Primarily Distributed by U.S. Corporations, Not Foreign Entities.

Other markets around the world require the solitary use of metric units on consumer products. Most dual labeled packages originate from the United States. Given that current federal law requires dual labeling on most packages, it was anticipated that metric products in the U.S. marketplace would be from foreign manufacturers or distributors, however the opposite was found. The majority of the packages with metric labeling were from U.S. companies (61 %, **Table 1**). The list of metric labeled products observed during this assessment is found in **Appendix C**.

Rates of Metric Labeling Vary in Different Retail Stores

Retailers, both small specialty stores and major national food chains, sell packages of domestic and imported foods and other products with only metric units (**Table 2**). Metric labels were observed in use on a wide variety of products currently sold in the U.S. marketplace. Examples of metric labels are found in **Appendix D**.

Table 2

Type of Store	Type of Products	Level of Metric-only
Regional Chain	Basic food products Store brands	Some
National Chain	Diverse products available Major brands	More
Local	Diverse Specialty or ethnic products	Most common or predominant

Dual Labeling Technology Available in Retail Stores

Under (a) and (b) of Section 11.32 of the Uniform Packaging and Labeling Regulation (UPLR, NIST HB 130) foods packaged at the retail store level are not required to have dual labeling. An exception permitting only inch-pound units was allowed to overcome the limitations of label printing technology. New labeling technology was observed being used in the U.S. marketplace that allows the inclusion of metric and inch-pound units on foods packaged at the retail store level.

Figure 2 - Dual labeling at a retail store level.

USDA Regulated Products

The assessment observed the net quantity of contents labeling practices from United States Department of Agriculture (USDA) inspected frozen and refrigerated pre-packaged food packages (e.g., dinners, breakfast, pizza, lasagna, and pasta meals). Currently, inch-pound units are mandatory and dual labeling is voluntary for these USDA products. It was anticipated that the majority of USDA inspected pre-packaged food would include net content containing inch-pound units exclusively. However, the marketplace has substantially adopted voluntary dual labeling (94.4 %, **Table 3**).

Table 3

USDA Regulated Products		
Total	750	100 %
Inch-pound	42	5.6 %
Dual	708	94.4 %
Metric	0	0 %

Conclusions

The long standing convention that the marketplace will determine when metric labeling is appropriate is becoming a reality. Some U.S. manufacturers are choosing to use metric labeling for their products, which is in conflict with the current FPLA. Metric labeling has emerged into the retail distribution supply chain without causing disruption to U.S. consumers and retailers. Consumers purchase packages that are labeled exclusively with metric units every day. Impacts appear to be minimal as metric labeled products are absorbed into normal retail functions. Metric packages are displayed alongside other dual labeled products and do not appear to interfere with normal retail operations, such as machinery, packaging and shipping containers, or shelving.

The assessment results show that there is a high level of compliance with dual labeling requirements in the food sector. There is a high level of voluntary dual labeling for meat and poultry products, especially products with other food components, for which metric unit use in the net quantity of contents statement is optional under federal meat and poultry labeling laws. Some retailers are using labeling technology that permits dual labeling for products packaged at the retail level. Expanding use of new technology will reduce and ultimately eliminate this historic labeling barrier from the U.S. marketplace.

The assessment revealed hundreds of technical violations of state and federal labeling requirements and regulations in the U.S. marketplace. Some violations include:

- Non English language use, which is required under all U.S. labeling laws and regulations;
- Labels bearing prohibited terms; and
- Absence of all required net quantity of contents information.

The assessment illustrates the need for the development of an aggressive information and educational program for both U.S. industry and regulators by the NIST WMD Laws and Metric Group.
