Server to Server

Approaches to definition of various Things

- By defining resources of things and its properties

- By defining functions/operations of things

BinarySwitch
- true(on), false(off)

Dimming
- dimmingSetting (int)
- step (int)
- range [0-100]

Brightness
- brightness (int)

Resources
- properties

e.g., Light bulb

SetSwitch
- Power(bool)

SetDimmingLevel
- dimmingSetting(int)

SetBrightness
- brightness (int)

Functions
- Input & Output Parameters

- (no Verbs) + Objects
  *Fixed set of verbs (CRUDN) from transport layer will be used
- Resource model in RESTful Architecture
  (e.g., W3C, CSEP, etc.)

- (Verbs + Objects)
- RPC model

# Support of Constrained Things
## Class 2 Devices as Defined by RFC 7228

- Less overhead/ Less Traffic
  - Minimize CPU Load, Memory impacts, Traffic and Bandwidth
    - Compact header
    - Binary protocol
    - Compressed encoding of payload

- Low Complexity
  - Simple Resource Model
    > Short URI (Late Binding w/ resource type defined)
    > Broad and Shallow Hierarchy

Support of Multiple Verticals

Home Health Domain

Insulin level low!
Need Help!

Smart Home Domain
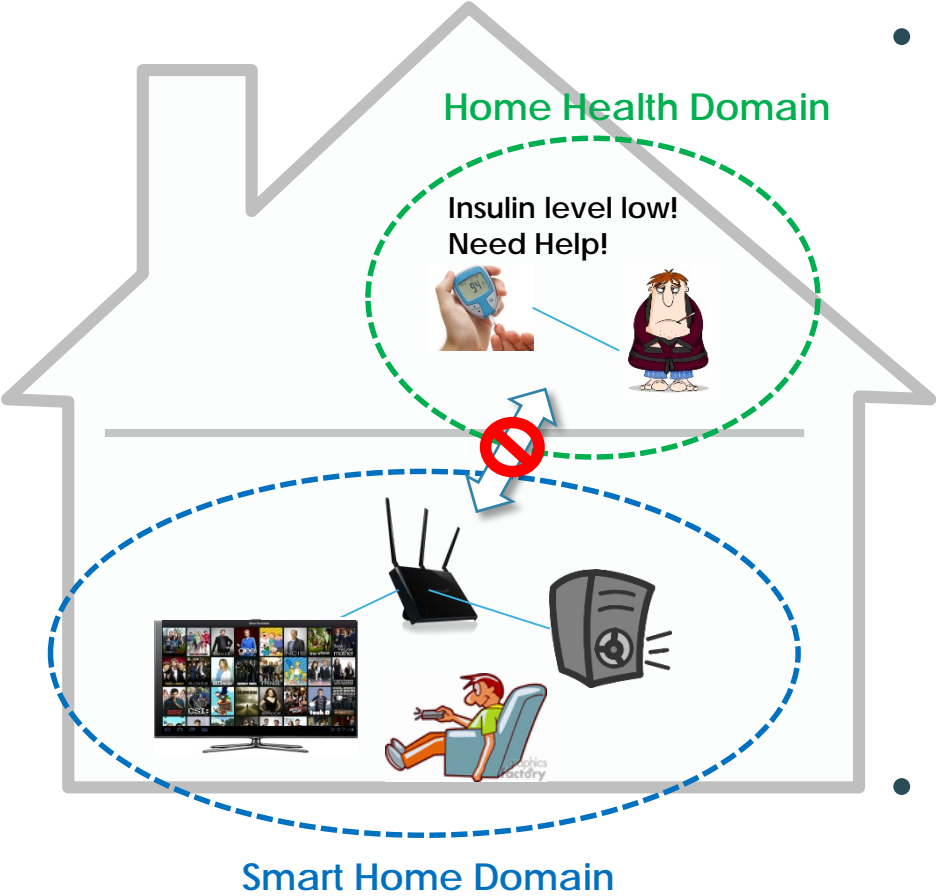

- Legacy vertical services usually designed as silos
  - → No common way to communicate among them

Health   Home   Industrial   . . .

Health   Home   Industrial   . . .

Common Platform

Health   Home   Industrial

Discovery
Addressing
Messaging
Security
...

- A common platform provides a foundation for vertical services to collaborate and interwork by providing common services and data models
Conformance & Certification

- Conformance test - Each device proves conformance to specifications

Device under Test

Conformance Test **PASS**

CERTIFIED

Certificate Issue & Logo Licensing

- Certification Scope

Optional Open Source Features

Optional Open Source Features

Mandatory (in spec, cert & committed in Open Source Project)

Tested **Optional** Spec Features

Optional Spec Features

Open Source

Specification

Licensing

- For Intellectual Property Rights(IPR) Policy : RAND-Z > RAND >> no IPR policy

- For Open Source : Apache 2.0 > Internet Systems Consortium (ISC)

- Due to the common nature of IoT connecting everything over the Internet, it's most critical for manufacturers to avoid a licensing risk
  - Everything connected could be at potential risk

- Offering manufacturer-friendly Licensing and IPR Policy enables growth of market by attracting both start-ups and large enterprises; such an IPR policy must be clear and readily understandable ensuring that the terms are offered by all member company IP holders.
Introduction to OCF – Optimized for IoT

RESTful Architecture

Common Platform

Certification Program

CoAP for Constrained Devices

Best In Class Security

OPEN CONNECTIVITY FOUNDATION™

OCF Areas of Technology Development

- Core Architecture
  - Fundamental resource framework
  - Discovery
  - CRUDN
  - Transport Binds
- Security
- Resource Models (vertical agnostic)
- Device Profiles
  - Smart Home
  - Health
  - Automotive
- Ecosystem Bridging

OCF Key Concepts (1/2)

- **Dedicated and optimized protocols for IoT (e.g. CoAP)**
  - Specific considerations for constrained devices
  - Fully compliant towards RESTful architecture
  - Built-in discovery and subscription mechanisms
- **Standards and Open Source to allow flexibility creating solutions**
  - Able to address all types of devices, form-factors, companies and markets with the widest possibility of options
  - Open Source is just one implementation to solve a problem

OCF Key Concepts (2/2)

- **Certification testing for interoperability**
  - Formal conformance testing for device validation to specifications
  - Plugfest testing for product interoperability
- **Certification and Logo program**
  - Products with the OCF Logo ensure OCF specifications are met
  - Logo reflects being part of an ecosystem of interoperable products

OCF Specification Overview

OCF Deliverables

Normative Specifications

- See next slide

Resource Models via oneIoTa

- Domain agnostic resources
- Derived models for Ecosystem Mapping
  - To date: OCF-AllJoyn (CDM 16.4), OCF-oneM2M, OCF-Zigbee (3.0)

Certification Procedures

- Test Policy (Certification Procedure Requirements Document)
- Test Plans and Test Cases (Certification Test Requirements Document)

Specification Structure

Infrastructure

- Core Framework and Extensions
- Security
- Bridging
- Device Specification

Resource Model

- Resource Specification (reflects OneIoTa content)
- Ecosystem Mapping Specifications (reflect OneIoTa content):
  - OCF to AllJoyn
  - OCF to oneM2M
  - OCF to Zigbee

Infrastructure:
Core Framework Specification

OCF 2.0.4 Release Overview

Core Framework Topics Outline (1 of 2)

- Objectives
- RESTful Architecture
- OCF Roles
- Resources
- Basic Operations
- Organization of an OCF Device
- OCF Specification Features
- Protocol Stack
- Device Example
- Endpoint Overview
Core Framework Topics Outline (2 of 2)

- Resource Discovery (CoAP Discovery)
- Block Transfer with CoAP Messaging
- Encoding Schemes
- Defining OCF Components
- Vendor Extensions
- Introspection
- Collection Resources
- Atomic Measurement Resources
- Alerts
- Device management
- Versioning
- Resource Discovery (Resource Directory)

Core Framework Objectives

- Core Framework Specification Scope
  - Specifies the technical specification(s) comprising of the core architectural framework, messaging, interfaces and protocols based on approved use-case scenarios
  - Enables the development of vertical profiles (e.g. Smart Home, Health) on top of the core while maintaining fundamental interoperability
- Architect a core framework that is scalable from resource constrained devices to resource rich devices
- Reuse open standards solutions (e.g. IETF) where they exist
- Ensure alignment with Iotivity open source releases

RESTful Architecture

Entity handler

Physical entity

Client

Server

REST Architecture Style

- Addressable resources
- A uniform, constrained interface
- Representation based manipulation
- Communicate statelessly
- Hypermedia State Engine

Request

Response

CRUD & N operation

Resource (representation)

```
{
    "n": "myRoomTemperature",
    "rt": "oic.r.temperature",
    "if": "oic.if.a",
    "id": "example_id_xyz",
    "temperature": 23,
    "units": "C",
    "setValue": 25
}
```

Resource (representation)

🔵 RESTful Architecture (Representational State Transfer)

- Resource based operation
  - Real world 'entity' is represented as 'Resource'
- Resource manipulation via Request/ Response: CRUDN

OCF Roles

- Current OCF Architecture defines 2 logical roles that devices can take
  - OCF Server : A logical entity that exposes hosted resources, is discoverable, and responds to client initiated transactions

  - OCF Client : A logical entity that interacts with resources on an OCF Server via discovery and CRUDN actions
- An OCF Device implements one or both roles

```
┌──────────┐                    ┌──────────┐
│   OCF    │                    │   OCF    │
│  Client  │───────────────────▶│  Server  │
│   Role   │                    │   Role   │
└──────────┘                    └──────────┘
```
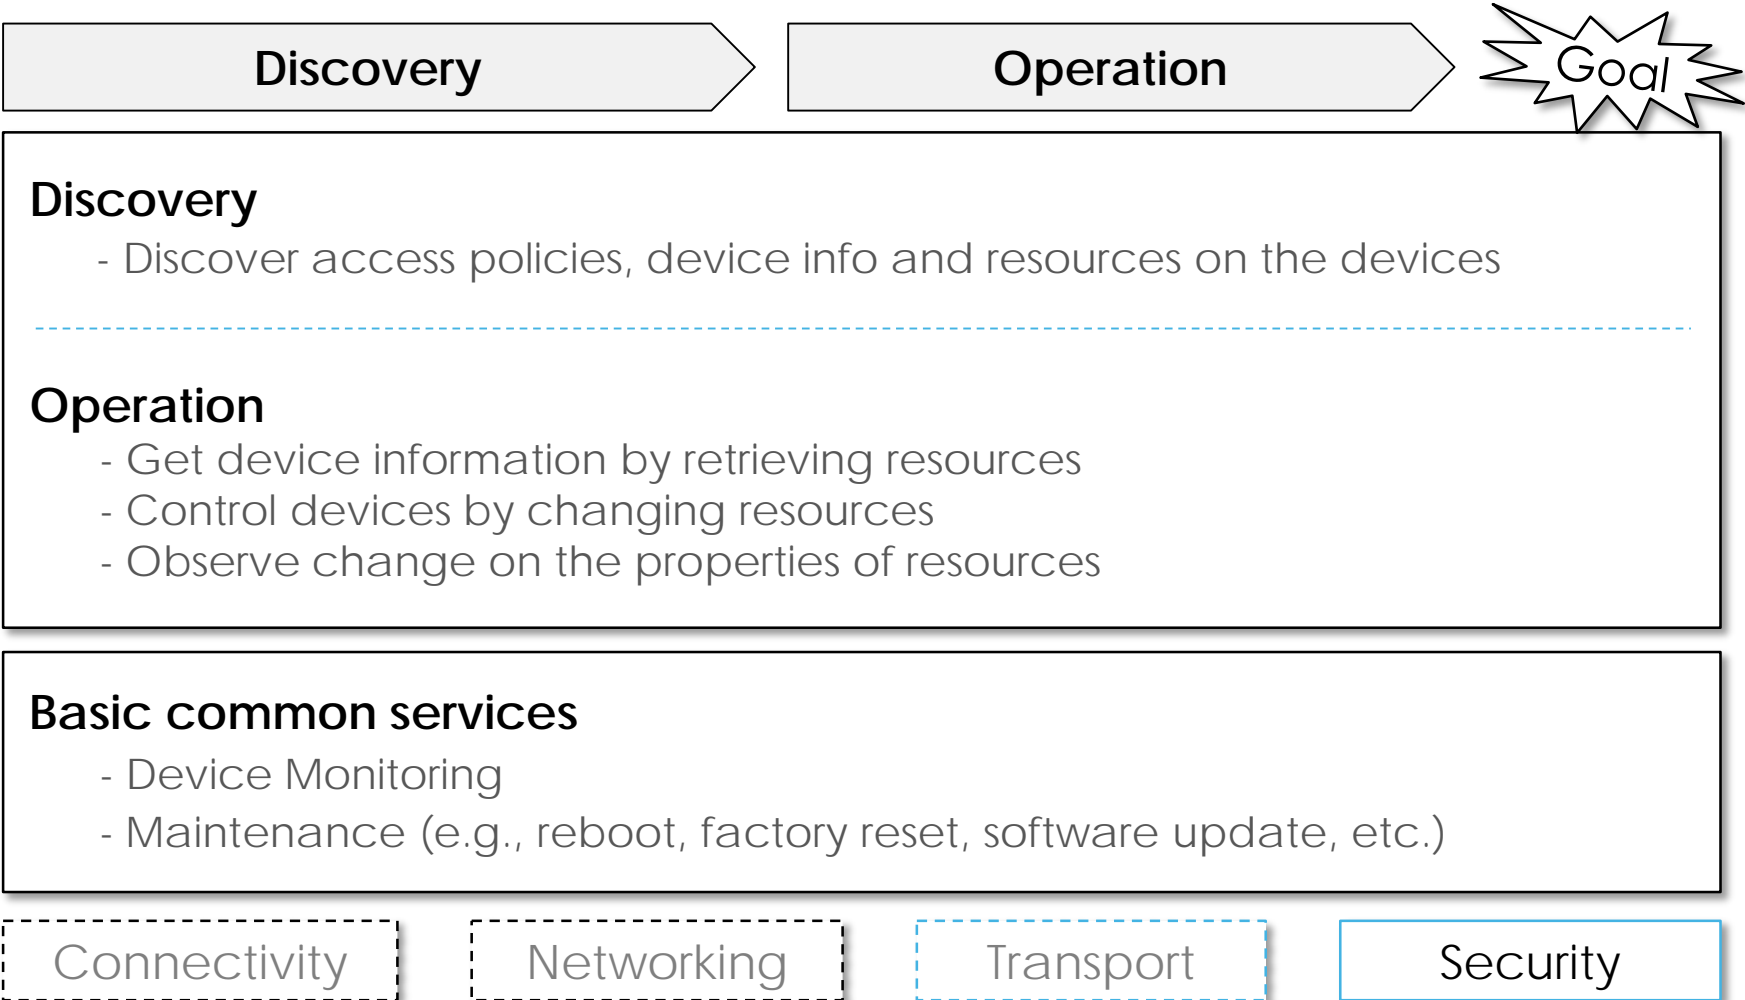

Resources

- An OCF Server contains one or more Resources to describe a real world entity

- Each Resource contains Properties that describes an aspect that is exposed through a Resource including meta-information related to that Resource

- Each Resource contains Interface(s) that provides first a view into the Resource and then defines the requests and responses permissible on that view of the Resource
OCF Core Framework Basic Operation

| Discovery | Operation | Goal |

Discovery
- Discover access policies, device info and resources on the devices

Operation
- Get device information by retrieving resources
- Control devices by changing resources
- Observe change on the properties of resources

Basic common services
- Device Monitoring
- Maintenance (e.g., reboot, factory reset, software update, etc.)

| Connectivity | Networking | Transport | Security |

Organization of an OCF Device

- OCF Device concept

Resource URI: /oic/p
- rt: oic.wk.p
- if: oic.if.r
- n: homePlatform
- pi: at1908
- mnmn: Samsung

/oic/p*

OCF Device 1
- /oic/res
- /oic/d
- /oic/p*
- Introspection

OCF Device 2
- /oic/res
- /oic/d
- /oic/p*
- Introspection

Physical Platform

* Note: /oic/p are all the same instance

OCF Spec Features – Core Framework Spec

① **Discovery:** Common method for device discovery (IETF CoRE)

② **Messaging:** Constrained device support as default (IETF CoAP) as well as protocol translation via bridges

③ **Common Resource Model:** Real world entities defined as data models (resources)

④ **CRUDN:** Simple Request/Response mechanism with Create, Retrieve, Update, Delete and Notify operations

⑤ **ID & Addressing:** OCF IDs and addressing for OCF entities (Devices, Clients, Servers, Resources)

⑥ **Protocol Bridge/GW**: Handled by the Bridging Spec with some implications on the Core

Security is fundamental to the OCF ecosystem and applies to all elements
Protocol Stack
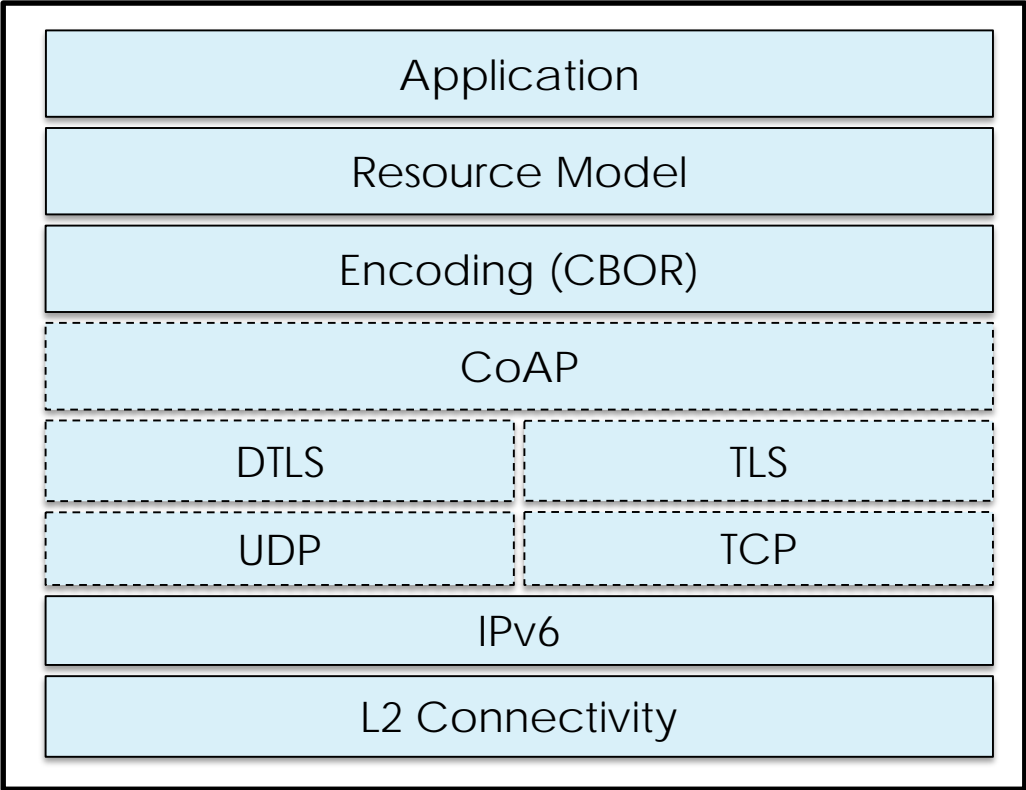

OCF Stack

Device example: light device (oic.d.light)

- Example overview
  - Smart light device with i) binary switch & ii) brightness resource
- Device type: Light device (oic.d.light) [Defined by the domain]
- Associated resources
  - Mandatory Core resources: oic/res, oic/p, oic/d
  - Mandatory Security Resources (not shown in the diagram)
  - Device specific resources: Binary switch (oic.r.switch.binary),
  - Other optional resources can be exposed, in this example Brightness resource (oic.r.light.brightness)

Example: Smart light device

Device Title	Device Type	Associated Resource Type	M/O
Light	oic.d.light	oic/res (oic.wk.res)	M
		oic/p (oic.wk.p)	M
		oic/d (oic.d.light)	M
		Binary switch (oic.r.switch.binary)	M
		Brightness (oic.r.light.brightness)	O

oic/res
oic/p
oic/d
Binary switch
Brightness

Endpoint Overview

- Definition
  - An (OCF) Endpoint is defined as the source or destination of a request and response messages for a given Transport Protocol Suites (e.g. CoAP over UDP over IPv6). The specific definition of an Endpoint depends on the Transport Protocol Suites being used.
    - an address (e.g. IPv6 address + Port number) or an indirect identifier (e.g., DNS name) resolvable to an address.
    - (e.g.) For CoAP/UDP/IPv6, Endpoint is identified as IP address + port number or DNS name.
- Endpoint characteristics for OCF Device
  - Each OCF Device shall associate with at least one Endpoint with which it can exchange Request & Response messages.
    - When a message is sent to an Endpoint, it shall be delivered to the OCF Device which is associated with the Endpoint. When a Request message is delivered to an Endpoint, path component is enough to locate the target Resource.
  - OCF Device can be associated with multiple Endpoints.
    - E.g. OCF Device may support both CoAP & HTTP
  - An endpoint can be shared among multiple OCF Devices, only when there is a way to clearly indicate the target Resource with Request URI.

Endpoint information in /oic/res with "eps" Parameter

`/oic/res`

```
[
  { "href": "/oic/res",
    "anchor": "ocf://dc70373c-1e8d-4fb3-962e-017eaa863989/oic/res",
    "rel": "self",
    "rt": ["oic.wk.res"],
    "if": ["oic.if.ll", "oic.if.baseline"],
    "p": {"bm": 3},
    "eps": [{"ep": "coaps://[fe80::b1d6]:44444"}] },
  { "href": "/oic/p",
    "anchor": "ocf://dc70373c-1e8d-4fb3-962e-017eaa863989",
    "rt": ["oic.wk.p"],
    "if": ["oic.if.r", "oic.if.baseline"],
    "p": {"bm": 3},
    "eps": [{"ep": "coap://foo.bar.com:44444"}, {"ep": "coaps://foo.bar.com:11111"} ] },
  { "href": "/oic/d",
    "anchor": "ocf://dc70373c-1e8d-4fb3-962e-017eaa863989",
    "rt": ["oic.wk.d", "oic.d.light"],
    "if": ["oic.if.r", "oic.if.baseline"],
    "p": {"bm": 3},
    "eps": [{"ep": "coap://[fe80::b1d6]:44444"}, {"ep": "coaps://[fe80::b1d6]:11111"} ] },
  { "href": "/myLight",
    "anchor": "ocf://dc70373c-1e8d-4fb3-962e-017eaa863989",
    "rt": ["oic.r.switch.binary"],
    "if": ["oic.if.a", "oic.if.baseline"],
    "p": {"bm": 3},
    "eps": [{"ep": "coaps://[fe80::b1d6]:44444"}, {"ep": "coaps://foo.bar.com:11111"} ] }
]
```

Endpoint for each target resource.

Resource Discovery (CoAP Discovery)

- OCF devices make use of CoAP Discovery using IANA defined OCF Service Address (not the default CoAP address).

- Multicast RETRIEVE (CoAP GET) sent to well known URI /oic/res

- Response is an array of links; each link represents a Resource hosted by the responding server

- Links provide:

  - href

  - Relationship (self link, hosted link, bridged link)

  - Endpoint binds

  - Supported interfaces

  - Observability of the Resource

Block Transfer with CoAP Messaging

- Basic CoAP messages work well for the small payloads we expect from light-weight, constrained IoT devices

- It is envisioned whereby an application will need to transfer larger payloads

- CoAP block wise transfer as defined in IETF RFC 7959 shall be used by all OCF Servers that receive a retrieve request for a content payload that would exceed the size of a CoAP datagram

Encoding Schemes – CBOR

- Everything in OCF is a Resource.
- All Resources are specified using OpenAPI 2.0 (aka Swagger) in JSON format to define the associated API
- OCF has mandated CBOR as the default encoding scheme on the wire

	CBOR	JSON	XML/EXI
Description	- Concise binary object representation based on JSON data model	- Lightweight, text-based, language-independent data interchange format	- Binary compression standard for XML
Standard	IETF RFC 7049	IETF RFC 7159	W3C Efficient XML Interchange Format 1.0
Content Type	/application/vnd.ocf+cb or	/application/json	/application/exi
OCF M/O	Mandatory	Can be supported	Can be supported

If needed in future revisions

Defining OCF Components (on top of CORE)

- OCF Servers
  - Defined by *device identifier*: standardized name of the device
  - List of mandatory OCF Resource Types per device
  - Note that OCF Clients are implicitly specified as "opposite" side of an OCF Server.
    - Currently OCF does not impose interaction sequences.
    - All instances of a Resource Type are allowed to talk to/from any OCF Client at any point in time
- OCF Resource Type
  - Defined by *resource identifier*: standardized name of the resource
  - List of mandatory properties per Resource Type
  - List of allowed actions (read/readwrite/..) per Resource Type
  - All OCF Resource Type IDs are IANA registered:
    http://www.iana.org/assignments/core-parameters/core-parameters.xhtml

Vendor Extensions

- Vendor is allowed to:
  - Create their own defined (non-OCF standardized) Resource Types
  - Create their own defined (non-OCF standardized) Device Types
  - Extend existing devices with additional (not mandated) Resource Types
    - With standardized resource types
    - With vendor defined resource types
- All vendor extensions follow an OCF defined naming scheme

Introspection

- Why
  - On par with existing AllJoyn framework
- What
  - Device description is available on the network
  - Device description:
    - List all end points
    - Per end point
      - Which method are implemented
        » Query parameters per method
        » Payloads definitions (request and response)
- How
  - Put the data described in OpenAPI 2.0 files on the wire as a CBOR encoded OpenAPI 2.0 (aka Swagger2.0) document.
    - Describes the payload on JSON level
      - Property names
      - Type
      - range

Introspection: Underlying rationale

- Use OpenAPI 2.0 files it as input for the OpenAPI 2.0 definition that will go on the wire.

- Same restrictions as already investigated and part of the:

  - 1 file to be transferred: e.g. definition includes

    - All end points, methods, query parameters, payload definitions

  - Same kind of negotiation to download the file

Collection Resources (Optional)

- An OCF Resource that contains one or more references (specified as OCF Links) to other OCF Resources, where each Link is individually addressable, is an OCF Collection

- An OCF Link embraces and extends typed "web links" as specified in RFC 5988

- The primary example of a collection is /oic/res (Discovery Resource).
  - A small number of Resources in the Resource Model are also collections

Atomic Measurement Resources (Optional)

- An OCF Resource that ensures a Client can only access the Properties of linked Resources (specified as OCF Links) atomically, as a whole, and read-only, using the "batch" interface

  - Atomically, meaning the value of all properties of the Atomic Measurement are sampled at the same time

  - As a whole, meaning that the values of all properties of the Atomic Measurement will be returned, or no value will be returned

  - Read-only, meaning that the properties of the Atomic Measurement can only be read, not written, using the batch interface. Any attempt to write to any property of the Atomic Measurement will result in an error.

- An OCF Link embraces and extends typed "web links" as specified in RFC 5988

- The primary example of Atomic Measurement Resources are with Healthcare vertical defined OCF Resources (e.g blood pressure measurement)

Alerts Resources (Optional)

- An OCF Resource that provides an interested party (clients) with regard to error or other conditions that the Device is experiencing
  - An Alert contains human readable text that is dependent on the Device itself and the condition being reported
  - A Device may expose discrete instances of an Alert Resource
  - A Device may expose zero or more Alert Resources within an Alert Collection
- The primary example of Alerts Resources are for a managing client, such as a service provider, to observe all alerts from all managed Devices

Device Management Resources (Optional)

- OCF Resources that provides an interested party (clients) to maintain and provide diagnostics for a Device

  - Resource to provide functionality for enabling factory reset, Device reboot, and last Device error information

  - Resource to enable monitoring the current network state of the Device

  - Resource to enable secure software updates for Devices in both managed and unmanaged networks
    - Download initiated by a vendor (e.g., Smart Home usage)
    - Download initiated by end user (e.g., Smart Home usage)
    - Download initiated by network manager (e.g., Industrial usage)

Versioning

Payload Versioning

- **Purpose**: client and server can understand each others payload.
- **Method**: resource model & encoding information in CoAP header

Device Level Versioning

- **Purpose**: OCF devices can be aware of each others version
- **Method**: icv (spec version), dmv (data model version) in /oic/d resource

Payload versioning

Media Type	ID
application/cbor	60
application/vnd.ocf+cbor	10000

Content-Formats

CoAP Option Number	Name	Format	Length (bytes)
2049	Accept Version	uint	2
2053	Content-Format Version	uint	2

Option Numbers

Version Representation

	Major Version					Minor Version				Sub Version					
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Version Example

OCF version	Binary representation	Integer value
1.0.0	0000 1000 0000 0000	2048
1.1.0	0000 1000 0100 0000	2112

Payload Versioning Use Case & Policies
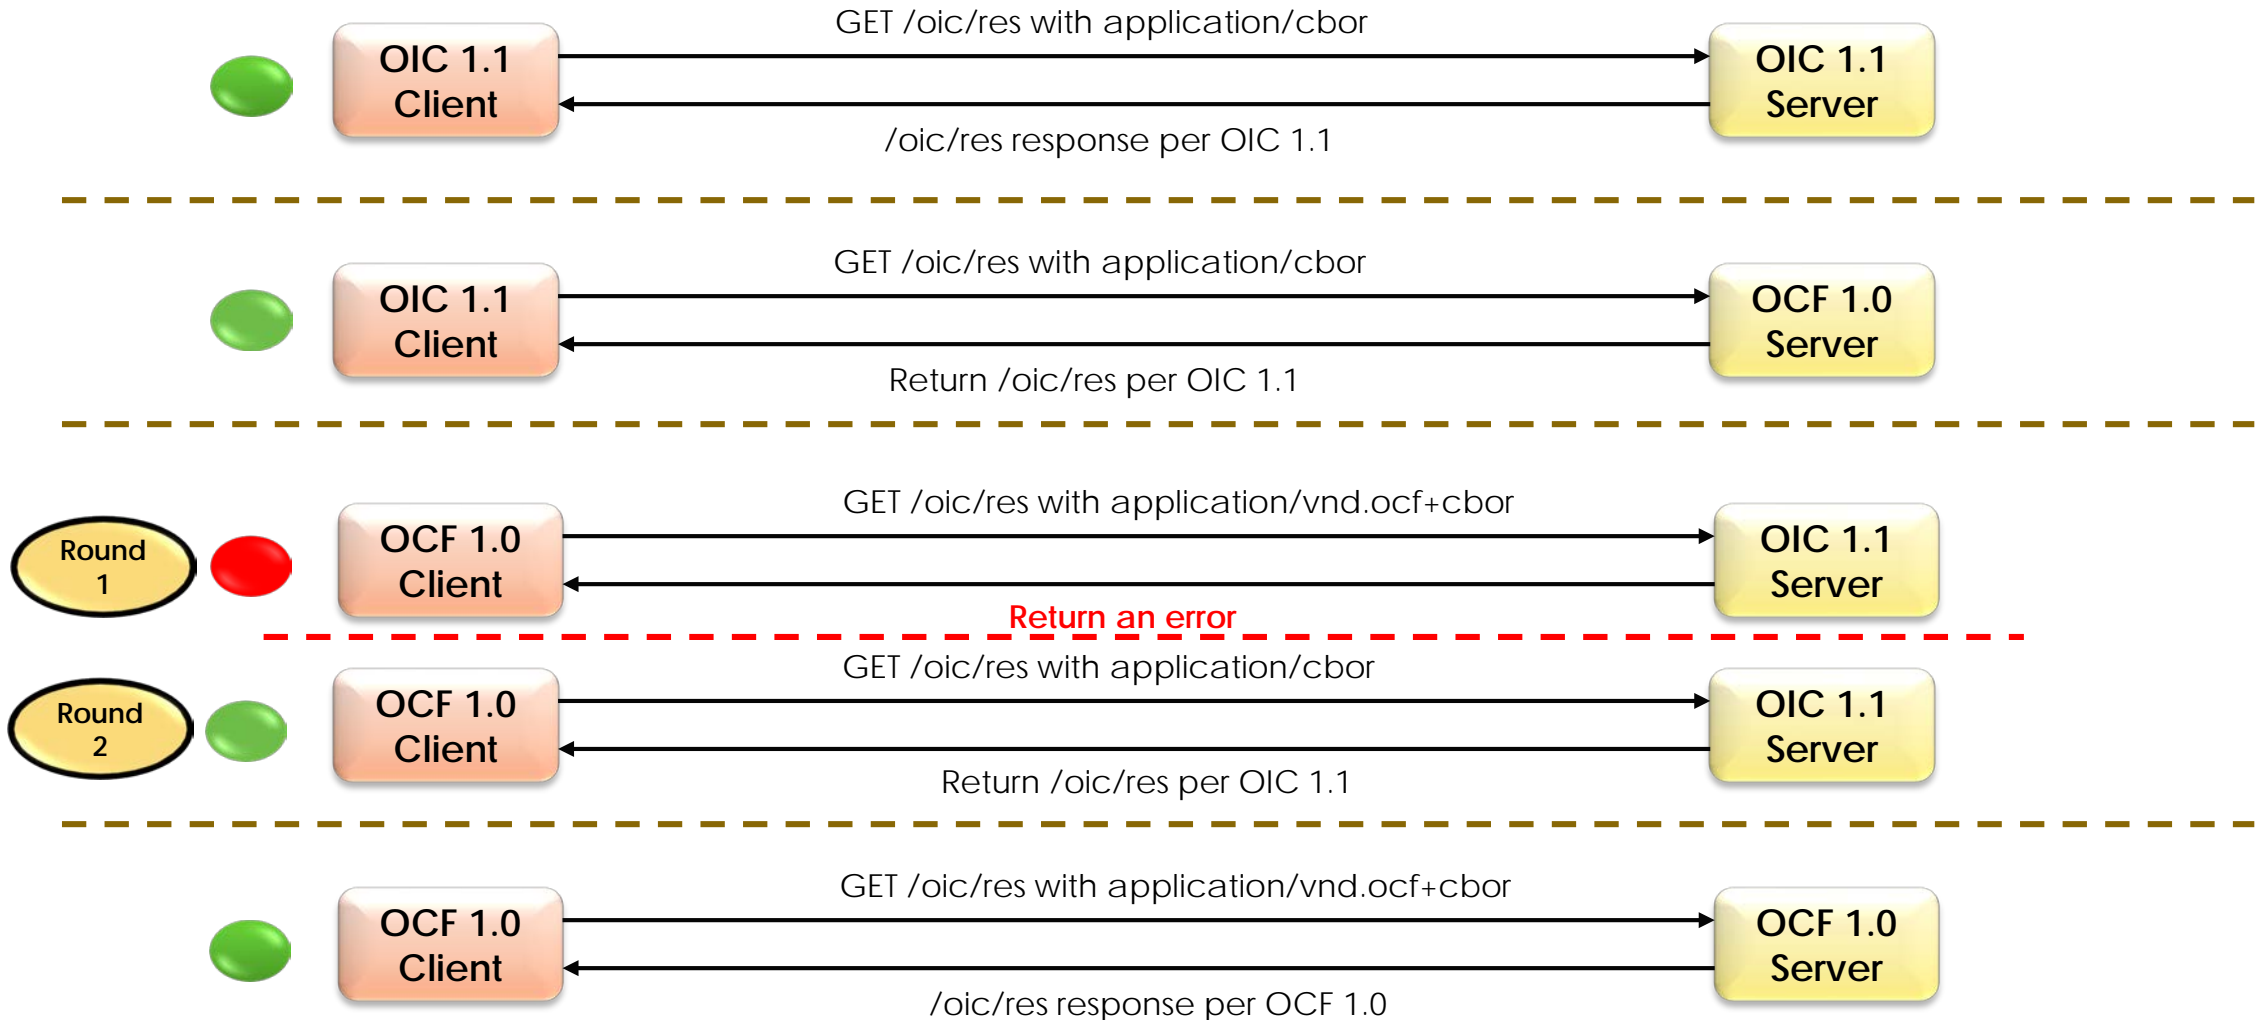

Resource Discovery (Resource Directory) (Optional)

- OCF Devices may use Resource Directory to find the Resources hosted in the 3rd party Devices.
  - Publishing Devices register the Resources (i.e. Links) to a Resource Directory, to which a Client subsequently makes an inquiry to discover those Resources.
- Resource Directory
  - An OCF Device facilitating indirect discovery by exposing 3rd party Resources (i.e. Links) with the following features
  - RD discovery
    - Discover an RD and select one with oic.wk.rd
  - Resource publish
    - publish/update/delete Resource (i.e. Links) in /oic/res of an RD
  - Resource exposure
    - Expose published Resources via /oic/res of RD, which is aligned with CoAP discovery.

OCF Specification Overview
Core Extension: OCF Cloud

OCF 2.0.4 Release

July 2019

Use Case

- Remote Control/Manage OCF devices based on user authentication
    - User can access OCF devices which belong to or are shared with him/her regardless of a location.
    - User can receive cloud providing service through the registered devices
        - EX) Device Management, Home security, Energy management and etc
- Usage & Operational Scenario
    1. Jane creates an account in the cloud

        - It is able to use the existing third-party account such as Facebook.

    2. Jane registers device resources under created account,

    3. She can control the device anywhere out of house

Turn off TV
OCF Cloud

Solution Overview
- OCF defines a logical function (termed an "OCF Cloud" in this presentation) which allows a Device to register itself "in the Cloud" and thus support remote access applications.

- All communication between the Device and "OCF Cloud" is over TLS.

- The logical "OCF Cloud" is hosted by any vendor that wishes to support the capability.

- OCF itself does not act as an "OCF Cloud" host

OCF Cloud Operational Flow

5 Device Registration .Resource Publish (Access token, device id)

6 Validate Token

Share User Authentication (Access token, user id)

4 TLS session

Token	di	userid
A0001	0xA71CE …	u0001

Authori sation Server

[OCF Resource Server]

[OCF Cloud]

2 Mediator Registration

1 Create user account

3 Cloud configuration (Cloud IP, Access token)

Access token

http

[Mediator]

[Note: The dotted interface is out of OCF scope]

Ⅰ. OCF Cloud User Account Creation

[OCF Cloud]

Share User Authentication (Access token)
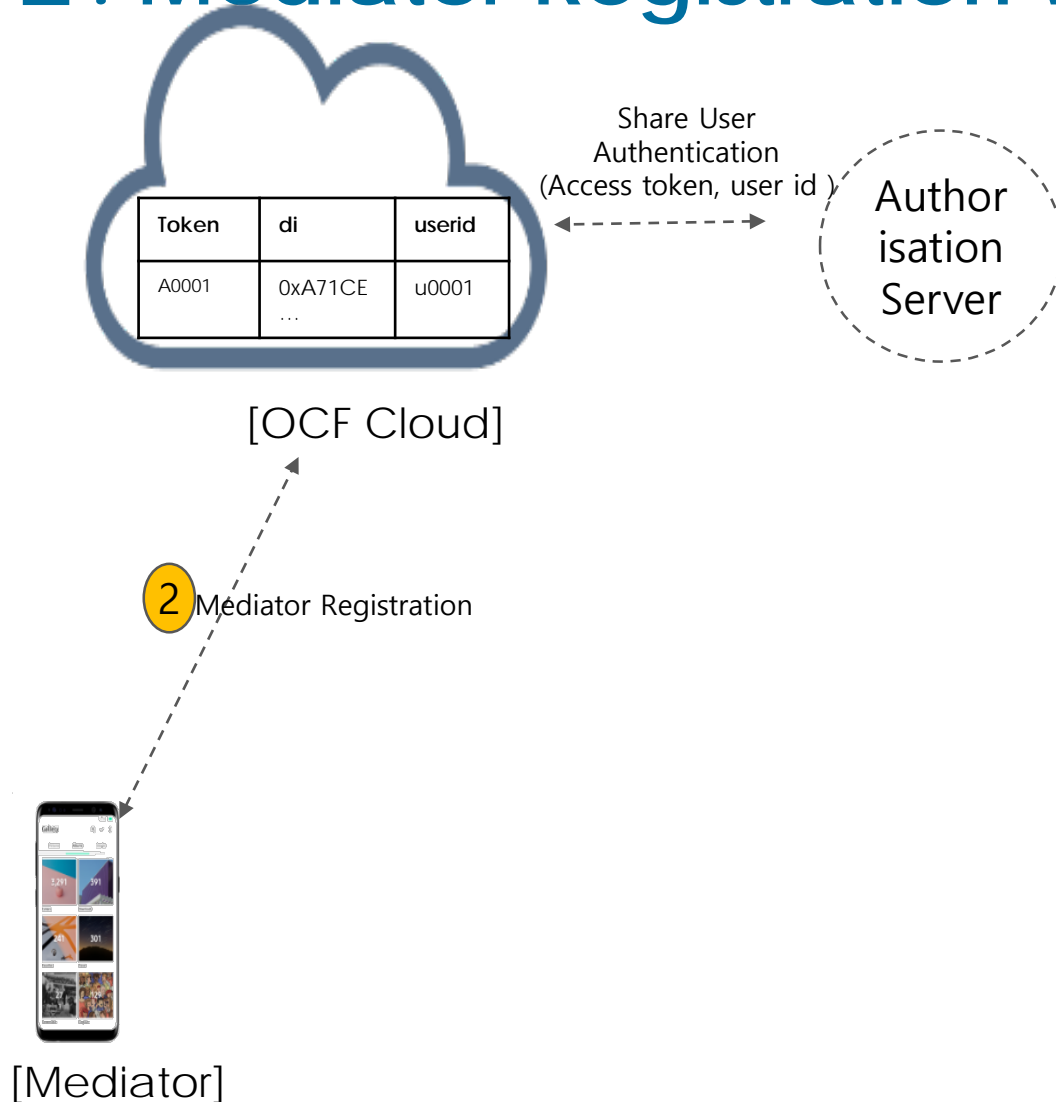

Authori sation Server

Create user account

1

Access token

http
[Mediator]

1. The OCF Cloud User downloads a Mediator onto their phone which will be used to Provision the Device.

2. The Mediator is configured with or through some out of band process to obtain the URL of the OCF Cloud (e.g. the Mediator may be an App from the Cloud Provider)

3. The OCF Cloud User has access credentials for the Cloud (i.e. user name/password or similar)

   - User can use his 3rd party user account

Ⅱ. Mediator Registration with the OCF Cloud

Share User Authentication (Access token, user id)

Token	di	userid
A0001	0xA71CE ...	u0001

Authorisation Server

[OCF Cloud]

2 Mediator Registration

[Mediator]

1. The Mediator provides this Access Token to the OCF Cloud.

2. The OCF Cloud may also provide a new Access Token (that is different from the Access Token provided by the Mediator). The Mediator is now registered. The "uid" identifies the OCF Cloud User. This "uid" is the same for all Mediator instances that may be associated with the OCF Cloud User

3. This same user ID can be used to assign multiple Devices to the same OCF Cloud User

Ⅲ. Device Provisioning by the Mediator

[OCF Resource Server]

③

Cloud configuration
(Cloud URI Access token)
[Mediator]

1. The Device is configured by the OBT by adding the required ACEs and creds to give the Mediator access to the CoAPCloudConf (CCC) Resource

2. The Mediator connects to the Device through normal OCF Discovery processes.

3. The Mediator updates the CCC Resource on the Device with the Access Token ("at") and OCF Cloud URI ("cis"). The Mediator may also provide the Auth Provider Name ("apn").

IV & V. TLS establishment and Device Registration with the OCF Cloud

[OCF Resource Server]   [OCF Cloud]
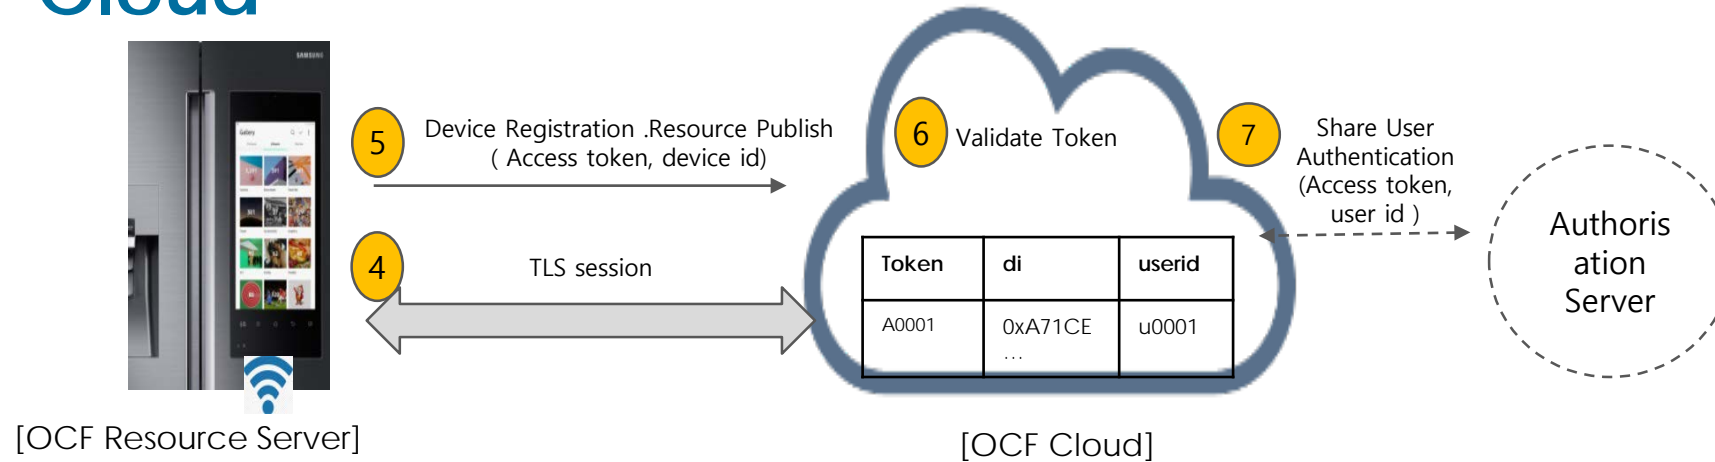

1. The Device establishes a TLS connection with the OCF Cloud using the properties in CCC resource.

2. The Device sends an UPDATE request to the Account Resource on the OCF Cloud which includes the following Properties: "di","accesstoken", "authprovider"

3. The OCF Cloud ensures that the "di" and the "accesstoken" match its current values. The "accesstoken" value is the same one that the OCF Cloud or Auth provider provided to the Mediator

4. If the values match, the OCF Cloud sends the Account Resource Properties in the UPDATE response

5. If the Device sends a RETRIEVE request to any of the OCF Cloud Resources, the OCF Cloud responds with an appropriate error code

6. Login with the OCF Cloud

1. In order to establish a TLS session and connect to the OCF Cloud to enable passing data between the two, the Device sends an UPDATE request to the Session Resource which includes:

   1. "di" – The value of "di" from "/oic/d" of the Device

   2. "uid" as supplied from the Account Resource UPDATE response

   3. "accesstoken" as supplied from the Account Resource UPDATE response

   4. "login": true

2. The OCF Cloud verifies that the values in the UPDATE request are correct and if so, the OCF Cloud sends a response message that includes the remaining session time ("expiresin").

3. The Device now has an active TCP connection and can exchange data.

VI. Publishing Links to the OCF Cloud RD

1. Once the TLS connection has been established to the OCF Cloud the Device publishes its Resources to the RD function of the OCF Cloud so that they can be seen/accessed remotely.

2. The acl2 and cred Resource of the OCF Device have to be provisioned by the OBT/AMS/CMS/DOTS to give the OCF Cloud the required CRUDN permissions.

VII. Client to Server Communication through the OCF Cloud

1. Clients must go through this same process and register with the OCF Cloud. All of an OCF Cloud User's Devices (Clients and Servers) will be assigned the access control right associated with the User ID

2. The OCF Cloud allows communication between all of a OCF Cloud User's Devices based on the fact that they have the same User ID.

3. When the Client attempts CRUDN actions on the Links hosted by the OCF Cloud, the OCF Cloud forwards those requests to the Device which responds to the OCF Cloud which then gets returned to the Client (i.e. Client -> OCF Cloud -> Device -> OCF Cloud -> Client).

VIII. Refreshing Connection with the OCF Cloud

1. When (or before) the "expiresin" timer expires, the Device should refresh its token by sending an UPDATE request to the Token Refresh Resource that includes:

   1. "di"

   2. "uid"

   3. "refreshtoken"

2. The OCF Cloud responds with a new

   1. "accesstoken"

   2. "refreshtoken"

   3. "expiresin"

IX. Closing Connection with the OCF Cloud

- If the Device wants to log out of the OCF Cloud, it sends an UPDATE request to the Session Resource which includes:

  - "di", "uid", and "accesstoken" as supplied from the Account Resource UPDATE response

  - "login": false

X. Deregistering with the OCF Cloud

- The Device sends a DELETE request message to the Account Resource which includes: "accesstoken","di"

- The OCF Cloud sends a response message confirming that the Device has been deregistered.

  - To connect to the OCF Cloud again, the Device has to be provisioned by the Mediator again and then reregister with the OCF Cloud

Wi-Fi Easy Setup

OCF 2.0.4 Overview

Overview

- Easy Setup is the 1st step when a device is unboxed. Specifically for UI-Less devices this is very important step. Wi-Fi Easy Setup spec defines interoperable data model that can be used to configure Wi-Fi connection on a device using a common communication channel. It also provides a standard way of a device proximally advertising its presence for discovery by clients that will perform the configuration. Other than Wi-Fi connection setup, OCF 2.0 specification optionally provides a way to configure connection with OCF Cloud.

- **Objectives:**

  - Define data model to be used for Easy Setup of an unboxed device.

  - Define spec with standard device beaconing and lost connection behavior.

  - Define Device roles and provide informative flow of operation.

  - Reuse existing security mechanism for Device Ownership and Access Control.

Scenario(s) / Use cases

- Procedure

  - [1] A device is unboxed.

  - [2] Mobile connects to the unboxed device.

    - Using a Soft AP network when Wi-Fi transport is preferred.

    - Mobile transfers Home AP's information and other information.

      - SSID, password, security type of Home AP.

  - [3] Unboxed device connects to Home AP.

  - [4] (*Optionally*) Mobile transfers a cloud access information to the device via Home AP network.

  - [5] (*Optionally*) Unboxed device registers to OCF Cloud server.

Resource Directory

⑤ Device Registration to OCF Cloud server

③ Connect to Home WiFi AP

④ Transfer Cloud Access information Via WiFi AP Network

② Transfer WiFi AP Information Via Soft AP Network or BT/BLE connection

① Out of box

Roles & Definitions

- Easy Setup
  - Process of configuring an Enrollee to an Enroller using a Mediator (by transferring of essential information about the Enroller to the Enrollee).
- Mediator
  - Logical function that enables the Enrollee to connect to the target Network (Enroller). The Mediator transfers configuration information to the Enrollee.
  - Example: Mobile phone/PC
- Enrollee
  - The Device that needs to be configured and connected.
  - Example: Air-conditioner, Printer.
- Enroller
  - The target network entity to which the Enrollee connects.
  - Example: Wi-Fi Access Point
- Soft AP
  - Software Enabled Access Point hosted on the Enrollee which is not a dedicated Access Point.

Resource Model - Structure

- 'EasySetup' resource is a collection
  - Easier to get all resources' properties when a GET request with BATCH_INTERFACE is sent to *conf resources

Resources

Properties

EasySetup Resource (Collection)
- Provisioning status
- Last Error Code
- Connect

WiFiConf Resource
- Wi-Fi AP information

DevConf Resource
- Device Name (read only)

CoAPCloudConf Resource (optional)
- Access Token
- Provider
- CI Server URL
Resource Model: Easy Setup

- Indicates easy setup status

Resource Name	Supported Interface	Example URI	Resource Type	CRUDN permission
EasySetup	Baseline, link-list, batch	/example/EasySetupResURI	oic.r.easysetup, oic.wk.col	RU

Property	Property Name(key)	Value Type	Value Rule	Access Mode	Mandatory	Description
Easy Setup Provisioning Status	ps	integer	enum	R	Yes	Indicates the easy setup provisioning status of the device (0: Need to Setup, 1: Connecting to Enroller, 2: Connected to Enroller, 3: Failed to Connect to Enroller, 4~254: Reserved, 255: EOF)
Last Error Code	lec	integer	enum	R	Yes	Indicates a failure reason if it fails to connect to Enroller (0: NO error, 1: A given SSID is not found, 2: Wi-Fi password is wrong, 3: IP address is not allocated, 4: NO internet connection, 5: Timeout, 6: Wi-Fi Auth Type is not supported by the Enrollee, 7: Wi-Fi Encryption Type is not supported by the Enrollee, 8: Wi-Fi Auth Type is wrong (failure while connecting to the Enroller), 9: Wi-Fi Encryption Type is wrong (failure while connecting to the Enroller), 13~254: Reserved, 255: Unknown error)
Connect	cn	array of integer		RW	Yes	Indicates an array of connection types that trigger an attempt to connect to the Enroller to start (1 : Wi-Fi, 2 : Other transport to be added in a future (e.g. BLE))

Easy Setup – Wi-Fi Conf. Resource

- Contains Wi-Fi-related properties

Resource Name	Supported Interface	Example URI	Resource Type	CRUDN permission
Wi-Fi Conf.	Read Write, Baseline	/example/WiFiConfResURI	oic.r.wificonf	RU

| Property	Property Name(key)	Value Type	Value Rule	Access Mode	M / O	Description
Supported Wi-Fi Mode Type	swmt	array of string	enum	R	M	Indicates supported Wi-Fi mode types. It can be multiple. (i.e. "A", "B", "G", "N", "AC")
Supported Wi-Fi Freq.	swf	array of string		R	M	Indicates supported Wi-Fi Frequency by Enrollee. Can be multiple. (i.e. "2.4G", "5G")
Target Network Name	tnn	string		RW	M	Indicates SSID of Wi-Fi AP i.e. Enroller.
Credential	cd	string		RW	M	Indicates credential information of Wi-Fi AP (password used to connect to enroller).
Wi-Fi Auth Type	wat	string	enum	RW	M	Indicates Wi-Fi Auth Type (i.e. "None", "WEP", "WPA-PSK", "WPA2-PSK")
Wi-Fi Encryption Type	wet	string	enum	RW	M	Indicates Wi-Fi Encryption Type (i.e. "None", "WEP_64", "WEP_128", "TKIP", "AES", "TKIP_AES")
Supported Wi-Fi Auth Type	swat	array of string	enum	R	M	Supported Wi-Fi Auth types. Can be multiple. ("None", "WEP", "WPA_PSK", "WPA2_PSK")
Supported Wi-Fi Encryption Type	swet	array of string	enum	R	M	Supported Wi-Fi Encryption types. Can be multiple. ("None", "WEP-64", "WEP_128", "TKIP", "AES", "TKIP_AES")

Easy Setup – Dev Conf. Resource

- Store all device configuration required in easy setup process
- Store a device name used in easy setup process

Resource Name	Supported Interface	Example URI	Resource Type	CRUDN permission
Device Conf.	Read Only, Baseline	/example/DevConfResURI	oic.r.devconf	RU

Property	Property Name(key)	Value Type	Value Rule	Access Mode	M / O	Description
Device Name	dn	one of: string or array of object		R	M	Indicates a pre-configured device name in language indicated by 'dl' in /oic/con. or An array of objects where each object has a 'language' field (containing an IETF RFC 5646 language tag) and a 'value' field containing the pre-configured device name in the indicated language. The pre-configured device name is presented by enrollee to mediator during easy-setup process.

Example Easy Setup Flow (informative)

Easy Setup Flow
(Informative)

Mediator | Enrollee | Enroller

1 Soft AP Creation

2 Device Discovery & selection

3 Join Soft AP

Enrollee Discovery
4 Resource Discovery
5 Resource Found

Security Provisioning (Refer Security Spec)
6 Ownership transfer

Enrollee's Information Retrieval
7 Request Enrollee Information (easysetup/wificonf/devconf)
8 Response

WiFiConf
9 Request to update resources (wificonf)
10 Response (OK)

Connect
11 Request to connect (Wi-Fi)
12 Response (OK)

13 Disconnect Soft AP

14 Soft AP Destroy

15 Connect

16 Connect

Enrollee Discovery
17 Resource Discovery
18 Resource Found

Enrollee's Information Retrieval
19 Request Enrollee Information (easysetup/wificonf/devconf)
20 Response

Step1: Enrollee enables SoftAP
Steps 2-3: Mediator connects via the SoftAP
Enrollee Discovery: Steps 4-5:
   Mediator discovers the Enrollee OCF Resources
Security Provisioning: Step 6:
   Ownership Transfer
Enrollee Information Retrieval: Steps 7-8:
   Mediator Retrieves Configuration Resources
Wi-Fi Configuration: Steps 9-10:
   Mediator Updates Configuration Resources
Network Connect: Steps: 11-16
   Mediator instructs Enrollee to connect to configured Wi-Fi
   SoftAP disconnect and disablement
Enrollee Discovery and Retrieval: Steps 17-20:
Mediator discovers via Wi-Fi network

OCF Specification Overview
Security Specification

OCF 2.0.4 Release

OCF Security Summary

- OCF is concerned with
  - **Device Identity** (Immutable, Unique, Attestable)
  - **Onboarding** (including **Authentication, Authorization, & Auditing (AAA)**)
  - **Confidentiality** (Protect data and communications)
  - **Integrity** (Resources, device state, and transitions are all managed)
  - **Available** (not only at the device level but also secured so they don't impact the networks within which they operate)
  - **Lifecycle Management** (Including secure software update and verifications mechanisms)
  - **Future Security** (Looking at credential types, algorithms, and adapting to changes in the security landscape as it relates to the security of OCF devices, now and in the future)
- OCF key management supports device protection and authentication
- OCF uses Access Control Lists (ACLs) to manage authorization
- Secure device ownership transfer helps prevent attacks when devices are added to the network

Security Principals

- **Resources**: a data structure that defines the types, data and interfaces of a device; each can be Created/Retrieved/Updated/Deleted or to which Notification can be set based on appropriate access control

- **Access Control Entries (ACEs) and Access Control Lists (ACLs)** are entries and collections, respectively, of permissions granting one device access to a Resource.

- **Onboarding Tools (OBTs)** are OCF Devices that help bring other OCF Devices into the local network. The OBTs are collections of services, some of those are listed below:

  - **Access Manager Service (AMS)** creates and verifies access control permissions.

  - **Credential Management Service (CMS)** is the name and resource type for a device which is granted permission to create and manage security credentials.

  - **Mediator** provisions the OCF Device with information necessary for remote service management.

  - **Device Ownership Transfer Service (DOTS)** onboards the OCF Device.

  - **Ownership Transfer Mechanism (OTM)** is method of onboarding (e.g. using cert for authentication).

- **Secure Virtual Resources (SVRs)** are special security resources with severely restricted permissions and access management.

How OCF Security Protects Device Resources:
Simplified Onboarding Sequence

- *Unowned Device boots*
- **Discovery (unsecured):**
  - DOTS sends multicast to discover unowned devices no TLS
  - Unowned devices reply, including list of supported OTMs no TLS
- **Ownership Transfer:**
  - DOTS selects and configures this OTM to the new device no TLS
  - DOTS & unowned Device perform OTM, inc. TLS handshake TLS
  - DOTS configs SVRs to authorize itself, CMS and AMS TLS
  - *Device is now owned!*
- **Provisioning:**
  - CMS provisions credentials, AMS provisions access policies TLS
  - *Device is now provisioned and can commence normal operation*
- **Normal Operation:** TLS or no TLS
  - *Credentials and/or access policies can be updated by returning to Provisioning*

Device Provisioning States

RESET
Hard reset

Owned?	**No**
Provisioned?	**No**
Permitted operations	Device prepares SVRs for OTM

Success →

RFOTM
Ready For Ownership Transfer Mechanism

Owned?	**No→Yes**
Provisioned?	**No**
Permitted operations	DOTS configures /doxm to claim ownership. Configures owners of SVRs & their credentials in /cred

Success →

RFPRO
Ready For Provisioning

Owned?	**Yes**
Provisioned?	**No/Partly → Yes**
Permitted operations	CMS updates /cred AMS updates /acl2

Success →

← Need more provisioning

RFNOP
Ready For Normal Operation

Owned?	**Yes**
Provisioned?	**Yes**
Permitted operations	Normal Device-to-Device Operation subject to SVRs

SRESET Needed (from RFPRO)
SRESET Needed (from RFNOP)
Success (to RFPRO)

SRESET
Soft Reset

Owned?	**Yes**
Provisioned?	**Some SVRs Corrupted**
Permitted Operations	DOTS attempts to repairs SVRs

During RFNOP, there are two services available to the device serving lifecycle management functions:

1: Secure Check for Software Update Availability
2: Trigger Secure Software Update

*Device can transition to **RESET** from any state (these transitions are not shown)*

Credential Management

- OCF devices can support the use of both symmetric and asymmetric credentials for establishing secure communication

  - Symmetric Key is mandatory

  - Certificates public/private keys are supported

  - CMS must be able to support both

- Missing credentials could be procured from a CMS

- Credentials may have an expiration period

  - Expired credentials can be refreshed

Access Control

Is Light On?

Request → **acl[0]**

subject: DeviceID

Accept ← rsrc: [/a/light]

prms: **R**

Turn Light Off

Request → **acl[0]**

subject: DeviceID

Reject ← rsrc: [/a/light]

prms: **R**

Access Control

- Protect Resources of the OCF Server to control CRUDN access for entity requesting access
  - Any request to the OCF Server is subject to ACL(Access Control List) policy check
  - ACE (Access Control Entry) policy applies to a OCF Server hosted Resource
  - Each ACE has a permission which allows read or write operation
- Two type of access control mechanism are supported:
  - Subject-based access control (SBAC)
    - ACE specifies the identity of requestor
  - Role-based Access Control (RBAC)
    - ACE specifies the role to accept of the entity requesting access
- ACL can be changed/updated via the AMS
  - Wildcards are supported to ease ACL management
- ACL policies applies only at the OCF server side

Security Virtual Resource (SVR)

- OCF defines SVRs (Security Virtual Resource) to perform OCF security related functionality
  - "Virtual" is an artefact of legacy resource naming. It is in fact a full-fledged OCF resource
- Device Ownership Transfer Resource (/oic/sec/doxm) manage Device Ownership status
- Provisioning Resource (/oic/sec/pstat) manage Device Provisioning status
- Credential Resource (/oic/sec/cred) manages Device credentials
  - Credential Resource is used for establishing secure communication
  - For oic.sec.cred.trustca entries, also known as trust anchors for identity certificates, Subject ID has to match the ID of connecting OCF Device
  - Subject ID is used to verify identity of the OCF Devices and can be matched to ACLs
- Access Control List (/oic/sec/acl2) manages the Access Control Entry for the Resource Server

Security Virtual Resource (SVR)

Message Integrity and Confidentiality

- Secured communications between OCF Devices are protected against eavesdropping, tampering, and message replay.

- Unicast messages are secured using DTLS or TLS. Multicast messages are not secured.

- All communications are signed and encrypted.

- Communicating devices are required to authenticate each other. Communicating devices need to have useable credentials to talk to each other. If they are missing, the devices could contact the CMS to get them.

3 New Security Profiles for OCF 2.0

Independent improvements to Baseline

"Purple"
Enhanced Device robustness requirements

"Black"
OCF PKI Certificates Required

"Blue"
OCF Certification Status Check at Onboarding Time

- **Optional and Certifiable improvements to Baseline Security Profile**
  - Black requires an audited CA, Blue/Purple require a vetted CA. All three include significant improvements to Device security such as hardware key storage, improved cipher suite support, etc.
  - A Device may be certified as conforming to any combination of Profiles. (e.g. Blue & Purple; Black only; Black & Blue & Purple; etc.)
- **Interoperable:** Devices of different Profiles can co-exist and interoperate.
- **Cryptographically Attestable:** Certificate extensions allow encoding of security attributes and OCF certification information.
- **Consistent:** No change to OCF branding due to Security Profiles.

Baseline Security

Certificate-based Onboarding

Shared Key Onboarding

Anonymous Onboarding

Manufacturer Incentives to Use Security Profiles

- Purple: Manufacturer building a Device with requirement for measured boot and secure SW update, to improve device integrity (e.g. connect to cloud, healthcare or government).

- Black: Manufacturer wishing to require use of OCF PKI, which ensures certificates are signed by OCF PKI, and meet OCF Certificate Policy.

- Blue: Manufacturer wishing to use its own (or other non-OCF) CA, which must conform to OCF-defined CA vetting criteria.

"Purple"
Enhanced Device
robustness requirements

"Black"
OCF PKI Certificates
Required

"Blue"
OCF Certification Status
Check at Onboarding Time

Additional Commentary on Security Profiles

- The **BLACK** profile requires use of the OCF PKI, using certificates that all share a common OCF root. Issuance of a black-profile Certificate requires that the Device has passed OCF certification, and requires that the CA issuing the certificates undergoes a successful audit of their CA process (OCF Certificate Policy based on WebTrust for Certificate Authorities v2.1).

- The **BLUE** profile has certificates issued by CAs that have passed a successful audit of their CA process. The Certification Status of the Device is verified at onboarding time against the OCF's Certification Management System. Currently, an extensible model for distributing audited CA's public roots to the OBTs is under design, but shorter-term, a list of vetted Roots can be found in the OCF Security Specification.

- The **PURPLE** profile adds some additional attestations that the manufacturer is asserting, related to the integrity of the device. These attestations are on file with the OCF Certification Working Group, and are identified specifically inside the Certificate.

- For further details on the granular differences between these profiles, please see the OCF Security Specification v2.0.4

OCF Cloud (optional feature)

OCF Cloud enables Device interaction with cloud-hosted Resource Directory

3 SVRs are hosted on the cloud:

- Account
- Session
- Token refresh

User ID is used as a basis for access control; authentication is performed using token received from cloud during Device registration
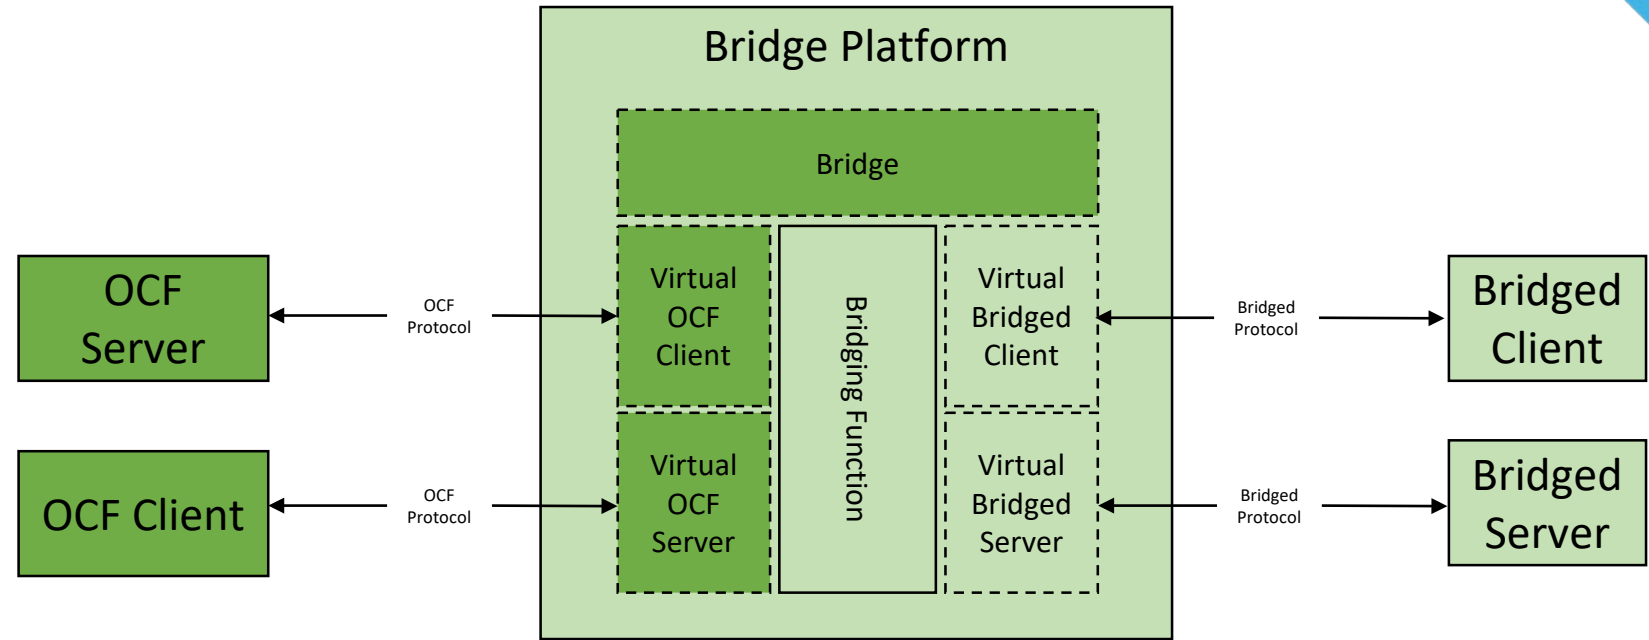

Initial Device provisioning for cloud connection is performed by the Mediator service. Mediator is usually hosted by OBT
OCF Bridging

OCF provides opportunity for OCF-vetted ecosystems to integrate into OCF ecosystem by implementing the **Bridging Function**

Bridge and Virtual OCF Device (VOD) are mostly independent OCF Devices, except:

- VOD can not be Owned, if Bridge is Unowned
- When Bridge becomes Unowned, Unowned VODs shall drop DTLS connections
- VOD may use manufacturer credentials hosted by Bridge

VOD is indistinguishable from OCF device, but has additional "oic.d.virtual" Device Type

Best Practices and Attestations

- Some security practices fall outside of our ability to test as part of OCF certification process.

- These are included in the Best Practices section of the Security specification. This section is not intended to be comprehensive, but is intended to provide guidance.

- Certification process requires signing of an OCF Attestation Document, which addresses specific security practices to which the manufacturer asserts compliance.

Infrastructure:
Bridging Specification

OCF 2.0.4 Overview

Bridging Specification

- Specifies a framework for **Asymmetric / Symmetric** translation between devices in OCF and non-OCF ecosystems.

  - In <u>symmetric bridging</u>, a bridge device exposes OCF Server(s) to another ecosystem and exposes other ecosystem's server(s) to OCF. In <u>asymmetric bridging</u>, a bridge device exposes OCF Server(s) to another ecosystem or exposes another ecosystem's server(s) to OCF, but not both.

- Provides **general requirements** for translation between OCF and non-OCF ecosystems

  - Requirements for resource discovery, message translation, security, etc

- Provides **specific requirements** for translation between OCF and specific ecosystems

  - Current specification supports AllJoyn and Zigbee (Symmetric Bridging), and oneM2M (Asymmetric Bridging), support for other ecosystems will be added

    - Requirements for mapping core resources, propagating errors, and in the case of AllJoyn, algorithmically translating custom resource types.

Ecosystem Mapping Specifications

- The detailed mapping to/from OCF Resources and the equivalent constructs in a bridged ecosystem are provided in what are known as Mapping Specifications

- These specifications define the mapping between Device representations (OCF Device Types) and Resource Representations

- The following Mapping Specifications currently exist:

  - OCF to AllJoyn Mapping specification for translating OCF Resources to AllJoyn Interfaces.

  - OCF to oneM2M Mapping specification for translating OCF Resources to oneM2M Module Classes

  - OCF to Zigbee Mapping specification for translating OCF Resources to Zigbee Clusters

OCF Bridge – Definition

- An OCF Bridge is a device that represents one or more non-OCF Devices (Bridged Devices) as "Virtual OCF Devices" on the OCF network and represents one or more OCF-Devices as "**Virtual Bridged Devices**" on the non-OCF network

- The Bridged Devices themselves are out of the scope of OCF.

- A "regular" OCF Device and a Virtual OCF Device are exactly same except that the Virtual OCF Device has "**oic.d.virtual**" as its "rt" value.

- An OCF Bridge is indicated on the network with an "rt" of "**oic.d.bridge**".
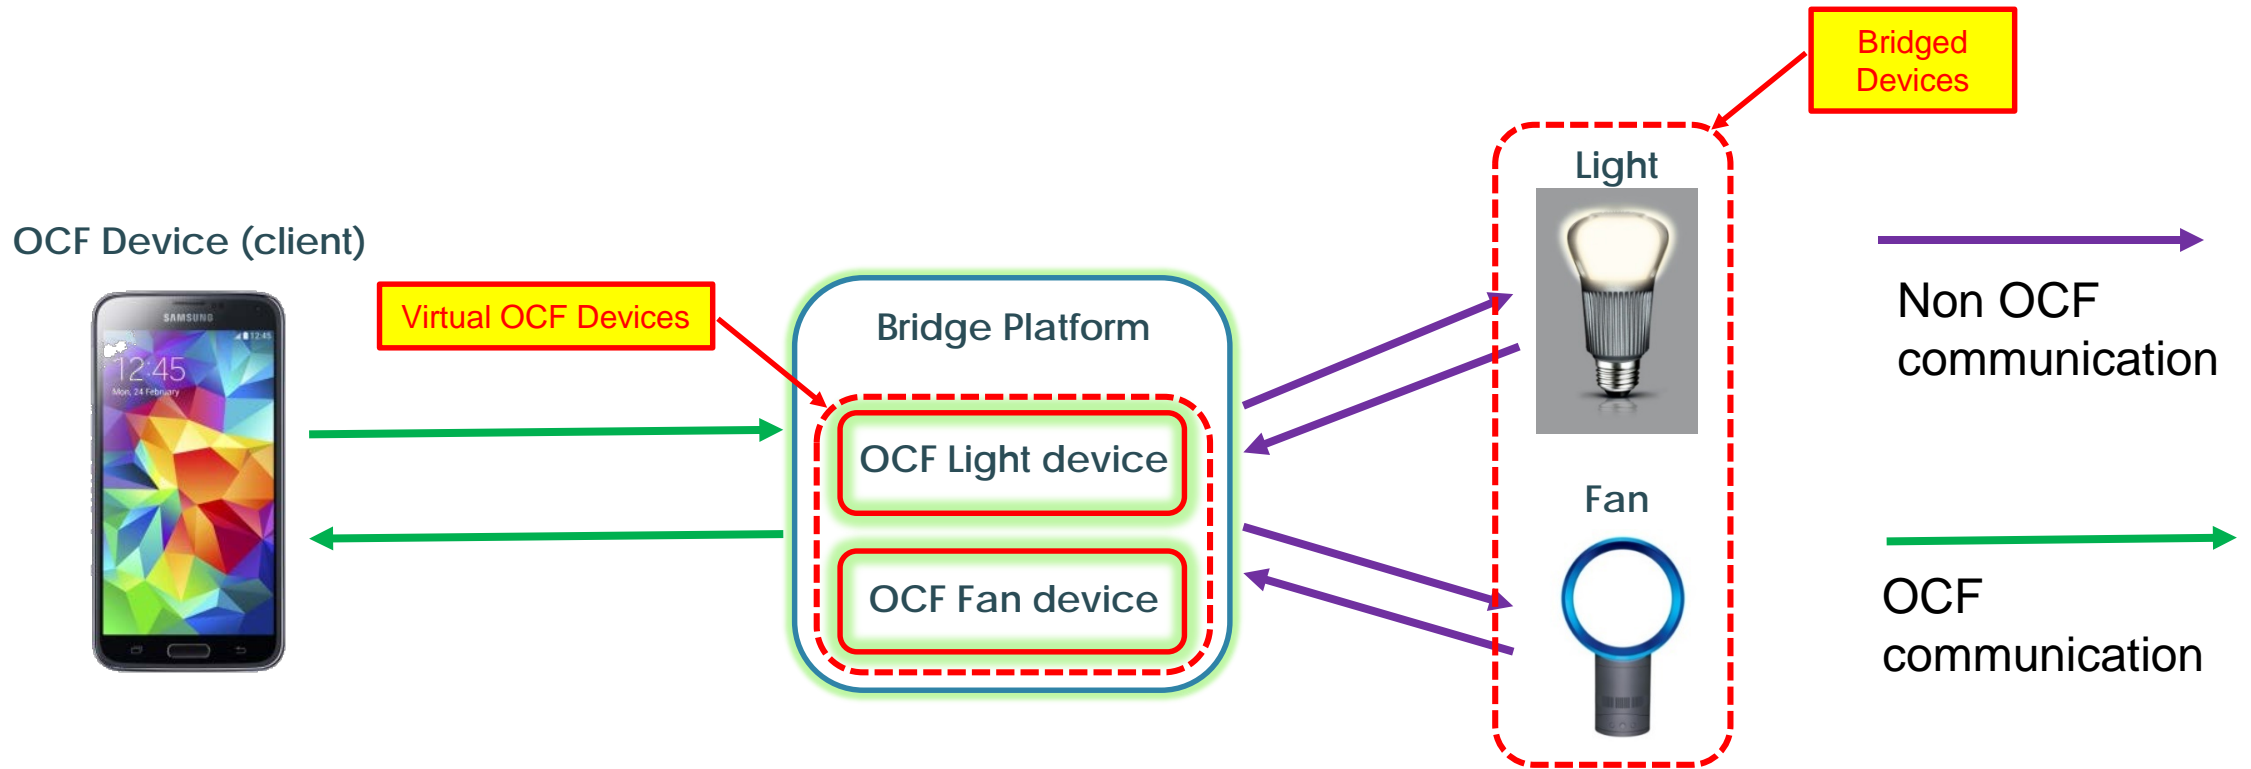

OCF Bridge – Definition

- An OCF Bridge exposes an instance of a VODList (Virtual OCF Device List) Resource ("**oic.r.vodlist**") which contains information about all Virtual OCF Devices (Clients or Servers) that are exposed by the OCF Bridge.

- For example consider an OCF to Zigbee Bridge that exposes a single Zigbee Thermostat as a Virtual OCF Device (Server), then the instance of "oic.r.vodlist" may be populated as shown:

```
{
  "vods": [
    {
      "n": "My Zigbee Thermostat",
      "di": "54919CA5-4101-4AE4-595B-353C51AA5678",
      "econame": "Zigbee"
    }
  ]
}
```
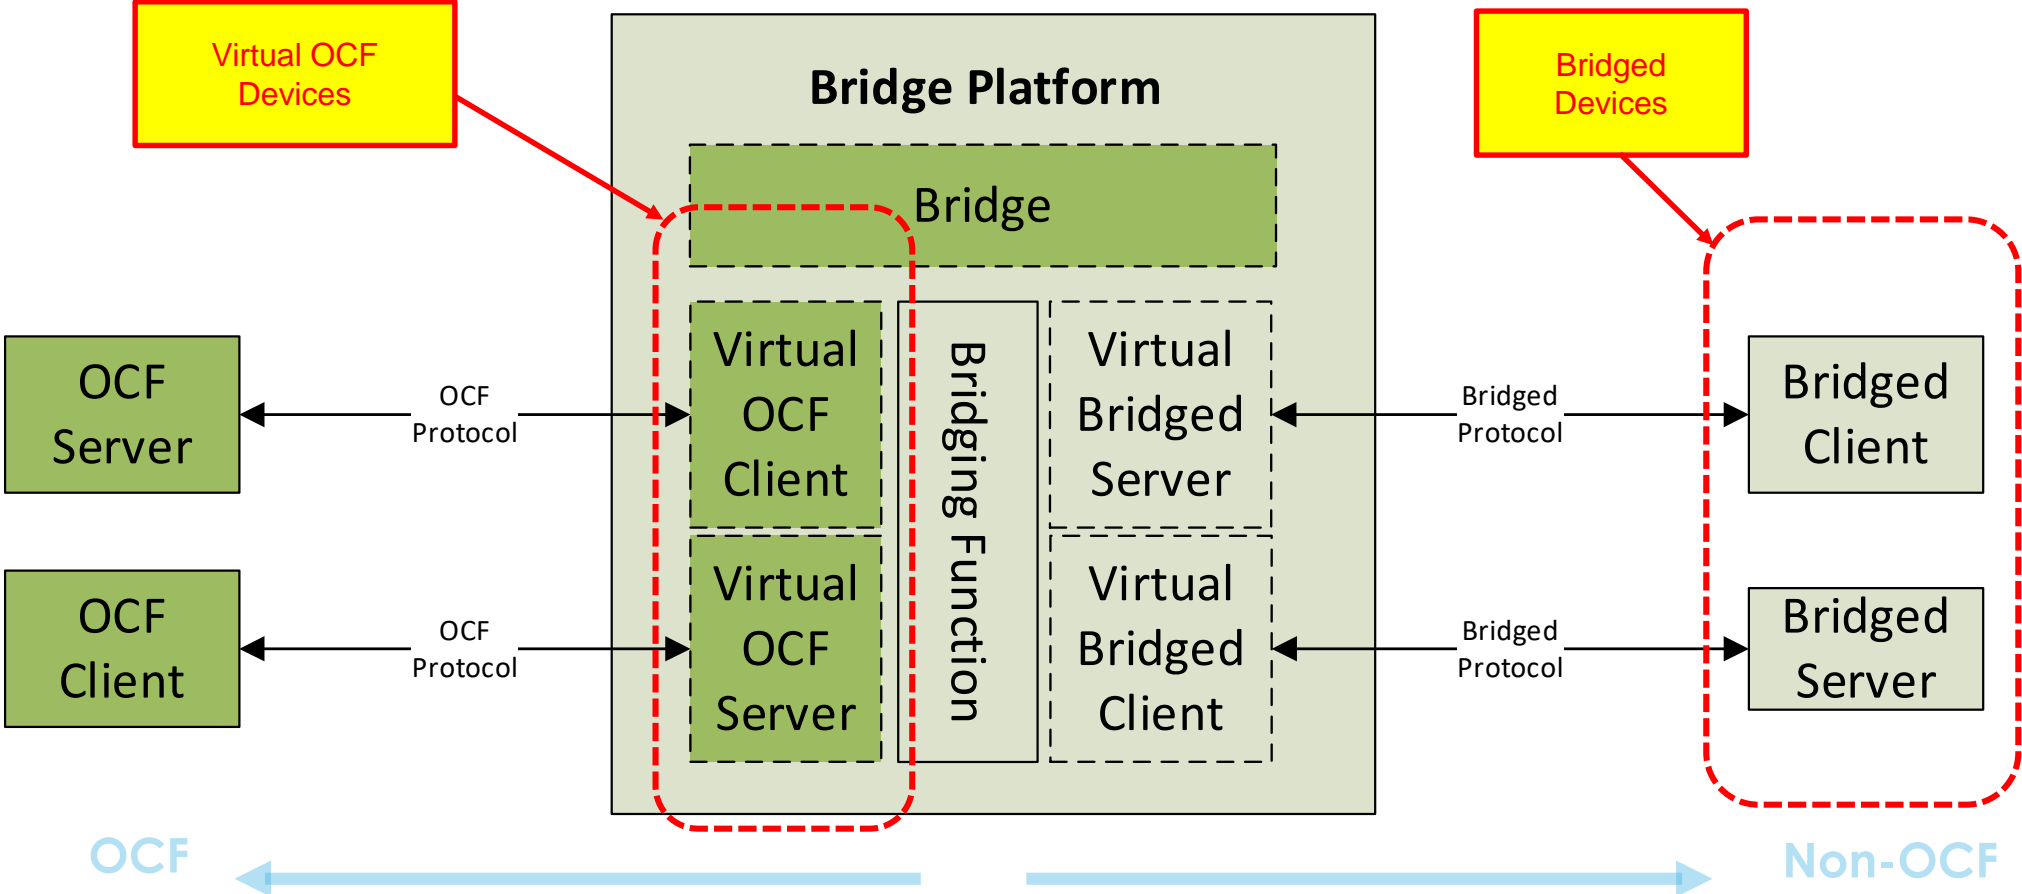

OCF Bridge – Definition

- Bridging example (Asymmetric Server Bridge)
  - Light and Fan are non-OCF Devices
  - Light and Fan are exposed as "Virtual OCF Devices" to OCF Devices by the Bridge
Bridging Concept – Operation

Bridging Concept – Data Model

OCF Resource Model ⟷ Derived Model ⟷ Non-OCF Ecosystem Resource Model

Resource Spec / Device Spec

Mapping Spec

Other Ecosystem Spec

Bridging Security

- The Bridge needs to be a trusted entity as it translates message payloads.

- The Bridge itself and all Virtual Devices that it exposes must be onboarded (transfer of ownership) and provisioned for secure operation.

- Each Virtual Device exposed by the Bridge must implement the security requirements of the ecosystem that it is connected to.

- Bridging specifies mechanisms to selectively block communications between the Bridge and OCF Devices and between the Bridge and Bridged Devices. This fine-grained control enables an administrator to control communications across ecosystems that may not have similar security capabilities.

# Ecosystem Bridging: Derived Models

Overview

Overview

- Models the interworking between OCF and the other ecosystem
- Makes use of derived model syntax as defined (with some small changes) in the OCF White Paper here: https://www.iab.org/wp-content/IAB-uploads/2016/03/OCF-Derived-Models-for-Interoperability-Between-IoT-Ecosystems_v2-examples.pdf
- Predicated on OCF being the superset model; so any Device Types and Resource Types (as equivalents to constructs in the other ecosystem) that were missing from OCF were defined in the equivalent OCF Specifications.
- Defines the mapping in terms of:
  - Device Type equivalency
  - Resource <-> other ecosystem equivalency
  - Detailed Property by Property mapping (Derived Models)

Derived Model Syntax

- Derived models use standard JSON schema syntax. Fundamentally, derived models provide a conversion mapping between OCF data models and the data models in the other ecosystem. The example below is for AllJoyn

```
"asa.environment.targethumidity": {
    "type": "object",
    "properties": {
     "targetvalue": {
       "type": "number",
       "description": "Measured value",
       "x-ocf-conversion": {
         "x-ocf-alias": "oic.r.humidity,oic.r.selectablelevels",
         "x-to-ocf": [
           "if minvalue != maxvalue, ocf.desiredhumidity = targetvalue;ocf.targetlevel = selectablehumiditylevels[0].",
           "if minvalue == maxvalue, ocf.targetlevel = targetvalue."
         ],
       "x-from-ocf": [
         "if x-ocf-alias == oic.r.humidity, targetvalue = desiredhumidity.",
         "if x-ocf-alias == oic.r.selectablelevels, targetvalue = targetlevel."
         ]
       }
     }
   }
```

AllJoyn Interface Name

AllJoyn Property Name

OCF Equivalent Resource Type

Ecosystem Bridges: OCF to Zigbee

Overview

OCF to Zigbee Device Type Mapping

Zigbee Device Type	Zigbee Device ID	OCF Device Type
On/off Output	0x0002	oic.d.smartplug
Mains Power Outlet	0x0009	oic.d.smartplug
Smart Plug	0x0051	oic.d.smartplug
On/Off Light	0x0100	oic.d.light
Dimmable Light	0x0101	oic.d.light
Color Dimmable Light	0x0102	oic.d.light
Color Temperature Light	0x010c	oic.d.light
Extended Color Light	0x010d	oic.d.light
Window Covering Device	0x0202	oic.d.blind
Thermostat	0x0301	oic.d.thermostat
Temperature Sensor	0x0302	oic.d.sensor
Occupancy Sensor	0x0107	oic.d.sensor
IAS Zone	0x0402	oic.d.sensor

OCF Resources to Zigbee Clusters

Zigbee Cluster	OCF Resource Type Name	OCF Resource Type ID	OCF Interface(s)
On/off	Binary Switch	oic.r.switch.binary	oic.if.a
Level Control	Dimming	oic.r.light.dimming	oic.if.a
Color Control	Colour Hue and Saturation, Colour Space Coordinates, Colour Temperature	oic.r.colour.hs, oic.r.colour.csc, oic.r.colour.colourtemperature,	oic.if.a
Thermostat	Temperature (3)	oic.r.temperature (3) * 1 for sensor, 2 for heater and cooler	oic.if.s oic.if.a
Window Covering	Window Covering	oic.r.windowcovering, oic.r.openlevel (4) * 2 for lift (percentage scale and cm scale), 2 for tilt (percentage scale and cm scale)	oic.if.rw oic.if.a
Temperature Measurement	Temperature	oic.r.temperature	oic.if.s
Occupancy Sensing	Presence Sensor	oic.r.sensor.presence	oic.if.s
IAS Zone	IAS Zone	oic.r.ias.zone	oic.if.rw

OCF Specification Overview
Device and Resource Modeling

OCF 2.0.4 Release

Resource Model:
Resource Type Specification

Overview

Resource Specification

- List of reusable resources that are used in an OCF Device
  - More than 100 Resource Types defined as of OCF 2.0.3 enabling Smart Home, Healthcare, and Industrial applications.
  - All Resource Types build on the Core definitions
- Each resource definition contains:
  - unique identifier (rt)
  - Identification of the default interface and other supported interfaces
  - List of supported methods

Resources are specified in OpenAPI2.0
(formerly known as 'Swagger 2.0')

See https://oneiota.org for the complete set of OCF defined Resource Types

Resource Type Map

- All OCF Resource Types are available in: https://oneiota.org

- A list of all currently accepted Resource Types with links to the OpenAPI definitions that are found in oneIoTa may be found here: https://openconnectivityfoundation.github.io/devicemodels/docs/resource.html

**If an OCF Server hosts an OCF known resource then it
shall follow all normative requirements in the Resource Specification applicable to that Resource.**

Newly Defined Resource Types – OCF 2.0.4

Resource Type	Use Case
Activity Tracker	Personal Health
Alarm	Smart Home
Calibrate for Continuous Glucose Meter	Personal Health
Sampling Interval for Continuous Glucose Meter	Personal Health
Sensor for Continuous Glucose Meter	Personal Health
Threshold for Continuous Glucose Meter	Personal Health
Heart Rate	Personal Health
Pulsatile Characteristic	Personal Health
Pulsatile Occurrence	Personal Health
Sleep	Personal Health
Sp02 for Pulse Oximeter	Personal Health

Device Specification

Overview

Higher Layer Specifications

- Specifications are split into 2 documents:
  - Device specification (per vertical Annexes if needed)
  - Resource specification (vertical agnostic)

The Device specification uses the resources defined in the resource specification

Device Specification

- Contains profiles of
  - Core specification
  - Security specification
- Contains list of OCF devices
- Each OCF device definition contains:
  - Human friendly name
  - unique identifier (rt) in the form oic.d.<thing>
Exposure of an OCF Device Type is Mandatory. If an OCF Server hosts an OCF known device
then it shall follow all normative requirements in the Device Specification applicable to that Device.

Device Categories

- All OCF devices are grouped into Device Categories based on the Universal Device Classification (UDC) that was developed by LBNL.

  - https://eta-intranet.lbl.gov/sites/default/files/lbnl-classification-v1.pdf

Device Category Name	Description
LBNL Categories	
Space Conditioning	Heating and cooling systems
Lighting	
Appliance	Also known as "white goods"; covers major appliances only.
Electronics	Personal electronics
Miscellaneous	Small appliances, other
Infrastructure	Physical building and infrastructure
Transportation	Vehicles, fixed devices that provide movement (e.g. Escalators)
Other	
OCF Added Categories	
Fitness	Includes lifestyle
Medical	
Personal Health	

Mandatory Resources per Device Type

- A vertical may specify a set of Resources that are mandatory to expose on a specific Device Type.

    - Note: a Device is free to expose any number of optional resources that it requires

    - Currently defined verticals: Smart Home, Healthcare, Industrial

- The complete set of Device Types and any associated mandatory resources that exist for a vertical are all available in github:

    - https://github.com/openconnectivityfoundation/devicemodels/blob/master/oic.devicemap-content.json

Some Example Device Types

Category	Name	Device Type	Mandatory Resources
Appliance	Refrigerator	oic.d.refrigerator	Temperature (x2)
Electronics	3D Printer	oic.d.3dprinter	Binary Switch, 3D Printer, Temperature, Printer Queue, Operational State
Miscellaneous	Optical Augmented RFID Reader	oic.d.orfid	RFID Tag, RFID Station
Personal Health	Body Scale	oic.d.bodyscale	Body Scale Atomic Measurement

Note: All defined Device Types are of the form "oic.d.<thing>" where <thing> is a single alphanumeric string (lower case [a..z],[0..9] only) no more than 24 characters in length giving a total maximum length of the Device Type of 32 characters

Complete Set of OCF Defined Device Types (1/2)

Friendly Name	Device Type
3D Printer	oic.d.3dprinter
Activity Tracker	oic.d.activitytracker
Air Conditioner	oic.d.airconditioner
Air Purifier	oic.d.airpurifier
Air Quality Monitor	oic.d.airqualitymonitor
Battery	oic.d.battery
Blind	oic.d.blind
Blood Pressure Monitor	oic.d.bloodpressuremonitor
Body Scale	oic.d.bodyscale
Body Thermometer	oic.d.bodythermometer
Camera	oic.d.camera
Clothes Dryer	oic.d.dryer
Clothes Washer	oic.d.washer

Friendly Name	Device Type
Clothes Washer/Dryer	oic.d.washerdryer
Coffee Machine	oic.d.coffeemachine
Continuous Glucose Meter	oic.d.cgm
Cooker Hood	oic.d.cookerhood
Cooktop	oic.d.cooktop
Dehumidifier	oic.d.dehumidifier
Dishwasher	oic.d.dishwasher
Door	oic.d.door
Electric Meter	oic.d.electricmeter
Electric Vehicle Charger	oic.d.electricvehiclecharger
Energy Generator	oic.d.energygenerator
Energy Monitor	oic.d.energymonitor
Fan	oic.d.fan
Food Probe	oic.d.foodprobe
Freezer	oic.d.freezer

Friendly Name	Device Type
Garage Door	oic.d.garagedoor
Generic Sensor	oic.d.sensor
Glucose Meter	oic.d.glucosemeter
Grinder	oic.d.grinder
Heart Rate Monitor	oic.d.heartratemonitor
Humidifier	oic.d.humidifier
Humidifier	oic.d.humidifier
Kettle	oic.d.kettle
Light	oic.d.light
Microwave Oven	oic.d.microwave
Optical Augmented RFID Reader	oic.d.orfid
Oven	oic.d.oven
Printer	oic.d.printer

Complete Set of OCF Defined Device Types (2/2)

Friendly Name	Device Type
Printer (Multi-Function)	oic.d.multifunctionprinter
Pulse Oximeter	oic.d.pulseoximeter
Receiver	oic.d.receiver
Refrigerator	oic.d.refrigerator
Robot Cleaner	oic.d.robotcleaner
Scanner	oic.d.scanner
Security Panel	oic.d.securitypanel
Set Top Box	oic.d.stb
Sleep Monitor	oic.d.sleepmonitor
Smart Lock	oic.d.lock
Smart Plug	oic.d.smartplug
Speaker	oic.d.speaker
Steam Closet	oic.d.steamcloset

Friendly Name	Device Type
Switch	oic.d.switch
Television	oic.d.tv
Thermostat	oic.d.thermostat
Water Heater	oic.d.waterheater
Water Valve	oic.d.watervalve
Window	oic.d.window

Items in red are new in OCF 2.0

Device and Resource Maps

A web front end to the github hosted device and resource maps that are maintained by OCF may be found here:

- https://openconnectivityfoundation.github.io/devicemodels/docs/index.html

OneIoTa Tool

- Web based (see: http://oneiota.org) development tool
- Supports RAML, JSON, and Swagger2.0 syntax
- Populated to date with all OCF Resources, Swagger2.0 versions of all such Resources, and OCF-AllJoyn derived models.
- Supports multiple organizations
  - Each submitting organization defines their own license terms
