IPv6 through modernization

Sigurd Thunem

IPv6 is an integral part of Telenor's vision of a future network.

- One common IP-network for.
 - Fixed Broadband
 - Mobile broadband
 - Business Services
 - IP-services; Voice, TV, VoD...
- An increasingly number of devices attaching to our network
 - Machine-to-machine and "Internet of things."
- Restored end-to-end paradigm will stimulate new innovations.
 - In addition, simplify our network.

IPv6 deployment is tightly coupled to customer demand, equipment support and content availability.

- A firm commitment from the whole internet community is required.
- Together with the internet community, Telenor will take necessary steps to provide a smooth transition to IPv6.

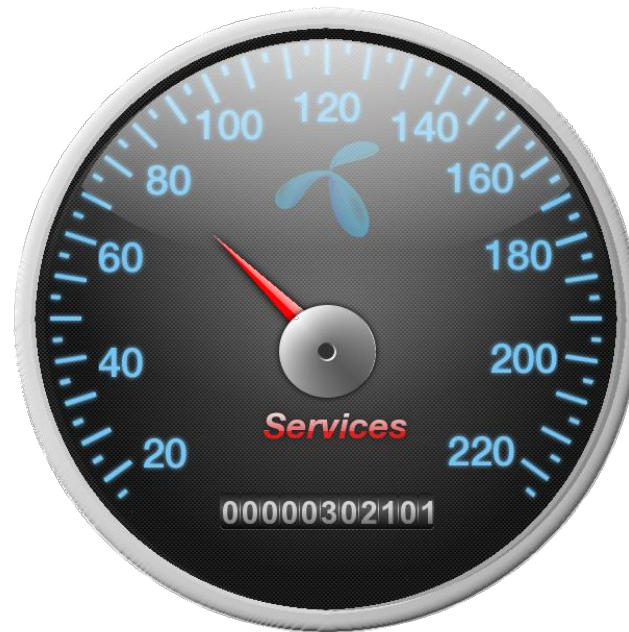

A massive modernization is taking place in Telenor's fixed/mobile network – Dual Stack is a natural part.

- IPv6 is part of all new product and platform related projects.
- Telenor will support Dual Stack in both the fixed and mobile network.
- Telenor's internal IS/IT systems are also being prepared for IPv6.

Where are we in the process of providing Dual Stack in the fixed and mobile network??

Within 2013, Telenor will offer IPv6 connectivity to all customers requesting this.
